New implementation

New features

Availability

☐ Implementation - Why new?

What was “wrong” with the previous implementation?

- Slow query responses
- No other output formats than VOTable
- No sorting options (by default on distance from target)
- Deprecated UCD1 (instead of UCD1+)
- Old code: Java Servlets

☐ Implementation - Why fast?

- To make a quick interrogation of Simbad on a given sky position
 - Simbad data daily changes => not possible to have a cache or snapshot.
 - Filter by number of references instead of distance
 - e.g. *Simbad pointer in Aladin returns the source with the max. number of ref.*
- So, should be as fast as possible which was not the case..

☐ Implementation - Evolution

- **Programming:**
 - Java 11
 - Web API framework: [Quarkus](#)
 - [Gradle](#) for dependencies management
- **Columns metadata:**
 - TAP_SCHEMA
 - Use same tables and columns as with Simbad-TAP
- **Performance improvement:**
 - Reactive programming
 - Native compilation

□ Features - Formats

- **Multiple response formats**
 - Parameter RESPONSEFORMAT (*defined by DALI*)
 - HTTP header Accept
 - VOTable (*last version: 1.4*)
 - JSON
 - FITS
 - CSV

□ Features - Size

- **Response size limit**
 - Parameter MAXREC (*defined by DALI*)
 - 0 to get only metadata
 - Upper limit defined by the server

□ Features - Sort

- **Sorting options**

- 2 parameters: ORDER_BY and ORDER_DIR
- ORDER_BY with the name of one of the output columns
(default: distance)
- ORDER_DIR: ASC (*default*), DESC

□ Features - Links

- **Columns link:**

- Object name/identifier: link to the Simbad Web page of the object (e.g. *M1*)
- Object type: link to the online object type description (e.g. *SNR*)
- *Available only in VOTable (LINK element) and JSON formats*
- *Compatible with Aladin*

□ Features - Parameters

SCS-1.03, sec. 2.:

*If a query includes an optional parameter, either one specified by this document or not, that is not supported by the service implementation, **the service must ignore that parameter.***

In this implementation:

- Incorrect parameter => ERROR
 - e.g. ORDER_BY or SORT_BY ; if SORT_BY is used, we want an error
- Incorrect parameter value => ERROR
 - e.g. unknown column name when ordering rows
- In both case, we need to see the error. Otherwise we will get a result which does not match our expectations.
- ***Discussed during the Cone Search Splinter: this paragraph should be updated in SCS-1.1.***

□ Features - Data origin

- **Extra response metadata:**

Inspired from [DALI-1.1](#) and draft note about data origin from DCP.

INFO name	Value	Description
standardID	ivo://ivoa.net/std/conesearch	IVOID of the service specification
service_protocol	Simple Cone Search 1.03-extended	Used access protocol and version
publisher	CDS/SIMBAD	Data publisher
request	https://simbad.cds.unistra.fr/cone/?RA=0.0&DEC=0.0&SR=5.0&VERB=1&MAXREC=10&ORDER_BY=distance&ORDER_DIR=ASC&RESPONSEFORMAT=votable	HTTP request URL
request_date	2023-04-17T15:30:54.431033294+02:00	Query execution date
contact	cds-question@unistra.fr	Publisher email address
QUERY_STATUS	OK	Successful query

□ Features - UCD

- **Use UCD1+**
 - ID column: `meta.id;meta.main` instead of `ID_MAIN`
 - RA: `pos.eq.ra;meta.main` instead of `POS_EQ_RA_MAIN`
 - DEC: `pos.eq.dec;meta.main` instead of `POS_EQ_DEC_MAIN`
- *Discussed during the Cone Search Splinter: agreed this should be changed in SCS-1.1 as it does not break existing clients (all already support UCD1+)*

Features - Extra

- Health
 - /availability **possible**
- Capability
 - /capabilities **possible**
- OpenAPI
 - Document describing the Web API (e.g. parameters, HTTP response codes)
- Online documentation
 - Generated with [Swagger](#)
 - Generated from the OpenAPI document
 - Lets interactively run queries

The screenshot shows the Swagger UI interface for the "Simbad ConeSearch API (development)". At the top, there are tabs for "Swagger UI", "openapi", and "Explore". The "Explore" tab is selected, showing the "ConeSearch" section. Below the tabs, there is a brief description: "Simple REST service implementing the IVOA protocol named Cone-Search.", "CDS - Website", and "Send email to CDS". A "Servers" dropdown is set to "http://simbad.cds.unistra.fr/cone". The main area is titled "ConeSearch Run Cone-Search queries." It features a "GET" button and a text input field labeled "Submit a Cone-Search query on the Simbad database.". Below this is a "Parameters" table with the following rows:

Name	Description
DEC (required) number (float) (query)	The declination of the search cone's center in decimal degrees. It must be between -90 and 90. Example : 0 0
MAXREC integer (int32) (query)	Maximum number of rows to return. 0 to get only metadata. Example : 2000 2000
ORDER_BY string (query)	Available values : B, G, H, I, J, K, M, U, V, coo, dec, dim, distance, main_id, morph_type, nb_ref, obj4, obj4ref, otype, otype_label, pts, pm, n, native, so, type. Default value : distance Example: Distance from cone center
ORDER_DIR (query)	Available values : ASC, DESC. Default value : ASC. Example: Ascending order
RA (required) number (float) (query)	The right ascension of the search cone's center in decimal degrees. It must be between 0 and 360. Example : 0 0
RESPONSEFORMAT string (query)	Desired output format. It should be a MIME-type or a shortcut. Example: voTable shortcut

□ Status

- **Old service:** *online (but closed at sometime)*
- **New service:** *online*
- **Registry:** *in progress*
- **Fallback parameter (v1.03):** *in progress (why note the VERSION parameter from DALI)*
- **Aladin & Topcat with new version:** *compatible*
