Abstract

This document describes the ProvTAP protocol for accessing provenance information according to the IVOA ProvenanceDM standard. It defines how the elements of ProvDM are described in the TAP schema tables and provides guidelines for implementing with TAP 1.1.

Status of this document

This is an IVOA Working Draft for review by IVOA members and other interested parties. It is a draft document and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use IVOA Working Drafts as reference materials or to cite them as other than “work in progress”.

A list of current IVOA Recommendations and other technical documents can be found at <http://www.ivoa.net/documents/>.

1 Introduction

1.1 context

ProvTAP is a TAP service specialization for delivering IVOA Provenance metadata and build up serialisation documents consistently with the IVOA Provenance data model (Riebe and Servillat et al., 2017) As for any TAP

service (Dowler and Rixon et al., 2010), ProvTAP is providing ADQL query responses consisting of a single table each, gathering columns selected from various tables defined in the service’s TAP schema. The default format of the Query Response is VOTable. Other formats (JSON, tsv, etc.) may also be optionally supported.

The definition of a ProvTAP service is similar to the approach used in the ObsCore specification (Louys and Bonnarel et al., 2011) where ObsCore data model plays the role of underlying model for ObsTAP services. It is also inspired by the multiple table design proposed in the the RegTAP specification (Demleitner and Harrison et al., 2013) with respect to VOResource data model.

Basically, data-model consistency for a TAP service is asserted by the datamodel element in the capability of the service. The relational view of the model is expressed via the table structure in the TAP schema and the definition of each column datatype, ucd, utype attributes in the same schema.

ProvTAP is not the only DAL service able to provide provenance metadata. The ProvSAP (?) specification offers a complementary method based on a search-by-parameters strategy and does not require the server to adopt the TAP architecture. ProvSAP services allow to retrieve sequences or sub-graphs of Provenance metadata associated to a starting entity or activity allowing different combinations.

1.2 Role within the VO architecture

IVOA ProvTAP specification is used to define TAP services with a specific TAP schema expressing view of the IVOA provenance Data Model. It relies on DALI for general DAL definitions. It benefits from existing IVOA notations and standards like UCD, VOUnits, VOTable, VOResource and extensions of the latter such as VODataservice and TAPREgExt.

Fig. 1 shows the dependencies of this document with respect to other existing standards.

2 ProvTAP in action

Here are a few examples of ADQL queries for ProvTAP (values are taken from the test metadata presented in appendix) :

- To retrieve all activity metadata for activities sharing the same activity-Description, by looking for the activities with the same a_description value:

```
SELECT * FROM Activity WHERE  
Activity.a_description = 'hipsgen15'
```

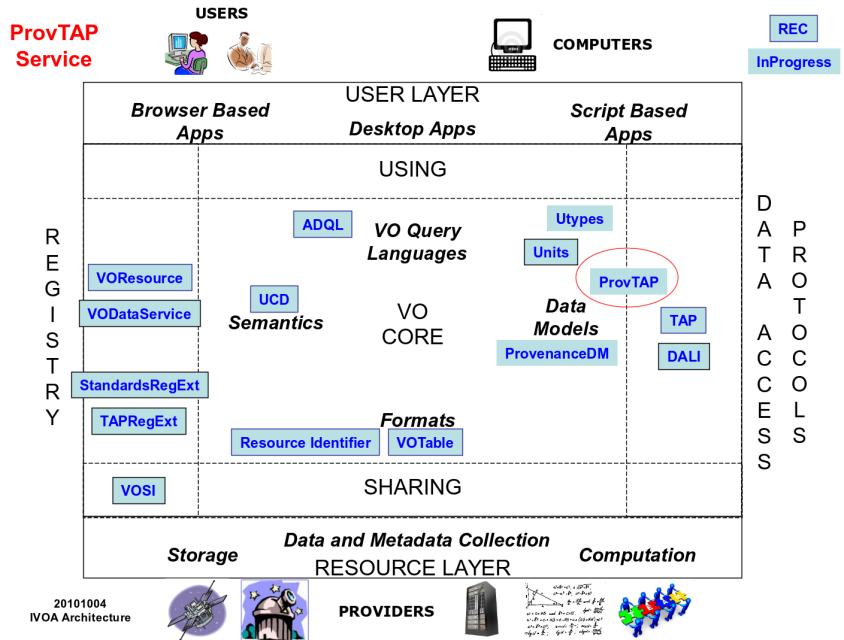

Figure 1: Architecture diagram for the ProvTAP specification. It is based on a view of IVOA Provenance data model and relies on TAP access technology. As such it is fully integrated in the IVOA framework

- To retrieve all activities associated with a specific agent:

```
SELECT WasAssociatedWith.waw_activity, Activity.a_name,
       Activity.a_comment FROM WasAssociatedWith
INNER JOIN Activity ON
WasAssociatedWith.waw_activity_id = Activity.id
WHERE WasAssociatedWith.waw_agent = 'agent_1_1'
```
- To retrieve all entities identifiers attributed to curator agents:

```
SELECT WasAttributedTo.wat_entity FROM WasAttributedTo
WHERE WasAttributedTo.wat_role = 'curator'
```

I have to modify, and enrich this section above by adding new queries

The result of the first ADQL query is the following.

```
<?xml version="1.0" encoding="UTF-8"?>

```

3 VOSI availability and capabilities

According to the DALI specification for VO services (Dowler and Demleitner et al., 2013), a provenance service implementing ProvTAP must provide a VOSI availability interface as well as a capabilities interface with entries for ProvTAP. The standardIDs for these provenance interfaces are:

`ivo://ivoa.net/std/ProvenanceDM#ProvTAP-1.0`

The capability for a TAP service to support the Provenance DM is expressed by the dataModel element as:

```

<dataModel ivoid="ivo://ivoa.net/std/ProvenanceDM-1.0">
  ProvenanceDM-1.0
</dataModel>

```

For ProvTAP, the VOSI tables interface must also be provided.

4 VOTable serialization for provenance metadata and ProvTAP TAP schema

The table and column definitions available in the TAP schema, including their metadata (`unit`, `ucd`, `utype`, `datatype`, `description`) exactly define the VOTable mapping of the IVOA Provenance data model (see table and column definitions and metadata).

Below is a serialisation format mapping the Provenance data model into VOTable. This format is useful to provide full serialisation of Provenance

metadata for an archive or data reduction workflow in VOTable. It can also be used to build the TAP schema of a ProvTAP service.

4.1 Tables in the VOTable serialisation or in the ProvTAP TAP schema

The following table gives the full list of tables necessary to map the IVOA Provenance data model. The contents of the ‘name’ and ‘utype’ columns of this table are normative.

Name	utype	Description	status
Entity	voprov:Entity	instances of <i>Entity</i> class	Mandatory
ValueDescription	voprov:ValueDescription	instances of <i>ValueDescription</i> class	Mandatory
DatasetDescription	voprov:DatasetDescription	instances of <i>DatasetDescription</i> class	Mandatory
Activity	voprov:Activity	instances of <i>Activity</i> class	Mandatory
ActivityDescription	voprov:ActivityDescription	instances of <i>ActivityDescription</i> class	Mandatory
Agent	voprov:Agent	instances of <i>Agent</i> class	Mandatory
Parameter	voprov:Parameter	instances of <i>Parameter</i> class	Optional
ParameterDescription	voprov:ParameterDescription	instances of <i>ParameterDescription</i>	Optional
ConfigFile	voprov:ConfigFile	instances of <i>ConfigFile</i> class	Optional
ConfigFileDescription	voprov:ConfigFileDescription	instances of <i>ConfigFileDescription</i>	Optional
Used	voprov:Used	instances of <i>Used</i> relationships	Mandatory
UsageDescription	voprov:UsageDescription	instances of <i>UsageDescription</i> relationships	Optional
GenerationDescription	voprov:GenerationDescription	instances of <i>GenerationDescription relationships</i>	Optional
WasGeneratedBy	voprov:WasGeneratedBy	instances of <i>WasGeneratedBy</i> relationships	Mandatory
WasAssociatedWith	voprov:WasAssociatedWith	instances of <i>WasAssociatedWith</i> relationships	Mandatory
WasAttributedTo	voprov:WasAttributedTo	instances of <i>WasAttributedTo</i> relationships	Mandatory
WasConfiguredBy	voprov:WasConfiguredBy	instances of <i>WasConfiguredBy</i> relationships	Optional
WasDerivedFrom	voprov:WasDerivedFrom	instances of <i>WasDerivedFrom</i> relationships	Optional
WasInformedBy	voprov:WasInformedBy	instances of <i>WasInformedBy</i> relationships	Optional
Collection	voprov:Collection	instances of <i>Collection</i> relationships	Optional

Table 1: List of tables in the TAP schema

For collection the idea is that a collection is a "type of entity". A "collection" relationship table contains id of the collection entity and id of related entity considered as member.

When the ProvTAP service is requested by generic ADQL queries involving optional tables which it doesn't include, it should not fail and the

response MUST be a table headed by the queried columns names and containing no data. An example of this is a query constraining the unit or ucd of a parameter sent to a service not implementing the configuration classes.

4.2 Detailed table description

Tables 2 to 18 provide full descriptions of the FIELDS of each of the mapping tables. The contents of all these tables' columns are normative. For convenience, in all these tables an arrow (\rightarrow) indicates columns that contain references (foreign keys) to other tables. The column names are prefixed by a short-cut for the table name in order to ensure unique column names in queries with table joins for ProvTAP.

Name	ucd	utype	datatype	status
e_id	meta.id	voprov:Entity.id	char	M
e_name	meta.title	voprov:Entity.name	char	O
e_type	meta.code.class	voprov:Entity.type	char	O
e_rights	meta.code.class	voprov:Entity.rights	char	O
e_location	meta.ref.url	voprov:Entity.location	char	O
e_generated	time.start	voprov:Entity.generatedAtTime	char	O
e_invalidated	time.stop	voprov:Entity.invalidatedAtTime	char	O
e_comment	meta.description	voprov:Entity.comment	char	O
e_classtype	meta.code.class	voprov:Entity.classtype	char OPTION	M
e_value	stat.value	voprov:Entity.value	char	O
\rightarrow e_description	meta.id	voprov:Entity.description_id	reference	O

Table 2: Column description for Entity table. The e_classtype column may have the following two values :"dataset" and "value"

PovTAP is actually dealing with two different kind of entities: "datasets" and "values". According to the value of the classtype attribute the description is given either by an instance of dataset description class, or by value description class.

Name	ucd	utype	datatype	status
dd_id	meta.id	voprov:DatasetDescription.id	char	M
dd_name	meta.title	voprov:DatasetDescription.name	char	O
dd_description	meta.description	voprov:DatasetDescription.description	char	M
dd_content	meta.description	voprov:DatasetDescription.contentType	char	M
dd_type	meta.code.class	voprov:DatasetDescription.type	char OPTION	M
dd_subtype	meta.code.class	voprov:DatasetDescription.subtype	char	M
dd_doculink	meta.ref.url	voprov:DatasetDescription.doculink	char	O

Table 3: Column description for DatasetDescription table. The value of type string belongs to a set of possible literal values given for instance using the VOTable OPTION element.

Name	ucd	utype	datatype	status
vd_id	meta.id	voprov:ValueDescription.id	char	M
vd_name	meta.title	voprov:ValueDescription.name	char	O
vd_description	meta.description	voprov:ValueDescription.description	char	M
vd_type	meta.code.class	voprov:ValueDescription.type	char OPTION	M
vd_subtype	meta.code.class	voprov:ValueDescription.subtype	char OPTION	O
vd_doculink	meta.ref.url	voprov:ValueDescription.doculink	char	O
vd_valueType	meta	voprov:ValueDescription.valueType	char OPTION	M
vd_unit	meta.unit	voprov:ValueDescription.unit	char	O
vd_ucd	meta.ucd	voprov:ValueDescription.ucd	char	O
vd_utype	meta	voprov:ValueDescription.utype	char	O
vd_min	stat.min	voprov:ValueDescription.min	char	O
vd_max	stat.max	voprov:ValueDescription.max	char	O
vd_default	meta	voprov:ValueDescription.doculink	char	O
vd_options	meta	voprov:ValueDescription.doculink	char	O

Table 4: Column description for ValueDescription table. The value of type, subtype and valueType strings belong to a set of possible literal values given for instance using the VOTable OPTION element.

do you want to suppress comment in value and Dataset Descriptions ? I think it's useful to keep them. Do we also add a generic Entity Description table ?

Name	ucd	utype	datatype	status
a_id	meta.id	voprov:Activity.id	char	M
a_name	meta.title	voprov:Activity.name	char	M
a_startTime	time.start	voprov:Activity.startTime	char	M
a_endTime	time.stop	voprov:Activity.endTime	char	M
a_comment	meta.description	voprov:Activity.comment	char	O
→ a_description	meta.id	voprov:Activity.description_id	char	O

Table 5: Column description for Activity table

Name	ucd	utype	datatype	status
ad_id	meta.id	voprov:ActivityDescription.id	char	M
ad_name	meta.title	voprov:ActivityDescription.name	char	O
ad_type	meta.code.class	voprov:ActivityDescription.type	char OPTION	O
ad_subtype	meta.code.class	voprov:ActivityDescription.subtype	char OPTION	O
ad_description	meta.description	voprov:ActivityDescription.description	char	M
ad_doculink	meta.ref.url	voprov:ActivityDescription.doculink	char	O

Table 6: Column description for ActivityDescription table. The value of type and subtype strings belong to a set of possible literal values given for instance using the VOTable OPTION element.

do you want to suppress "comment" in activity description ? I think it's useful to keep it

Name	ucd	utype	datatype	status
ag_id	meta.id	voprov:Agent.id	char	M

Appendix A TAP schema in xml

The ProvTAP TAP schema will be found on the IVOA xml document repository (currently available at:
<https://wiki.ivoa.net/internal/IVOA/ObservationProvenanceDataModel/ProvTAP-schema-new.xml>)

Appendix B TAP service content exemple. Database dump in VOTable.

The exemple available at URL :
<https://wiki.ivoa.net/internal/IVOA/ObservationProvenanceDataModel/ProvHiPS.xml>
provides information on data collections used or gathered by CDS in the context of Aladin. It starts from Schmidt plate collections and goes up to HiPS datasets and collections. These metadata are organized below into a set of related VOTables consistent with the ProvTAP TAP schema.

Appendix C Changes from Previous Versions

mireille: changed stopTime everywhere in endTime and ucd “time.stop” in “time.end” to ensure compatibility with provDM tables.
