

Italian Theoretical Virtual Observatory

Phase A study

U. Becciani(a), A. Costa(a)
F. Pasian(b), R. Smareglia(b), C. Vuerli(b)
C. Gheller(f), P. Malfetti(f)
V. Antonuccio(a), A. Bonanno(a),
S. Borgani(c), L. Tornatore(c,d)
G. Bodo(e)

- (a) *INAF - Astrophysical Observatory of Catania*
- (b) *INAF - Information Systems - Trieste*
- (c) *University of Trieste*
- (d) *SISSA - Trieste*
- (e) *INAF - Astronomical Observatory of Torino*
- (f) *CINECA - Bologna*

Background

- **Data Provider:**
 - **Observational Instrument → produce enormous quantities of data (image, spectra, ...)**
 - Telescope
 - Satellite
 - **Computer and numerical Simulation → huge amount of data .**
 - Local beowulf cluster
 - Grid environment (EGEE, DEISA)
 - HPC (CINECA)

HPC Background

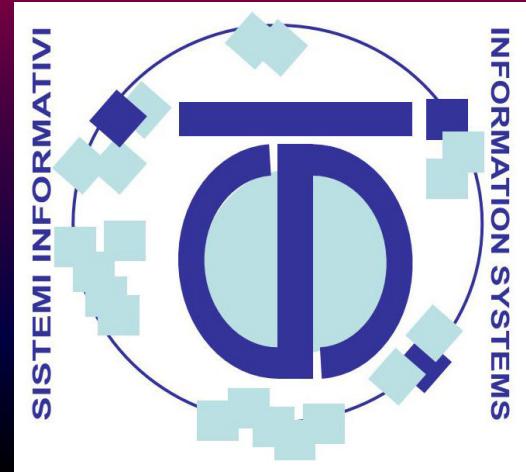

- From 1997 agreement from CINECA and INAF*: a big investment of National Community for the computer Facility.
 - More than 300 computational HPC projects
 - Cosmological Simulation
 - AGN jets
 - Evolution of globular Cluster
 - Large scale structure of the Universe
 -
 - Many of this data, produced by using this National Facility, are not organized, and their usage are limited to research groups Data Policy....

Grid Background

- 2002-2005 INAF was involved into the Grid.it Project with INFN
- 2003-2005 INAF was founded to developed the DRACO Project (Datagrid for Italian research in Astrophysics and Coordination with the virtual Observatory)
 - Grow expertise
 - Developing tools (G-DSE: Query Element)
 - Planck Simulations
- INAF is unfunded, generic application, partner in EGEE
- INAF-OACT participate to the Trigrid project and COMETA consortium
- A lot of simulated data were and will be create in a Grid environment.

Now

- INAF - Information System
 - Coordination with CINECA
 - Coordinating INAF GRID initiative
 - Coordinating INAF Vobs initiative
 - IVOA presence
 - VO-TECH
 - DS4, DS5, DS6
 - VO-DCA
 - WP5
 - VObs.it
 - IA2
 - Italian Center for Astronomical Archive
 - ITVO
 - Italian Theoretical Virtual Observatory

Theory → VObs

- How to implement numerical simulation in the VObs framework
 - Common features with Obs. Data can be found
 - Some deep differences are present
 - .. Amount of different quantity that are used in the simulations (different physics, algorithms, etc..)
 - Data are not generated from “organization”
 - Difficult to create a generic data model, like to that of observational data.
 - Try it! But, of course, starting from well know Case Study.

ITVO : Case Study

- N-Body and SPH Cosmological Simulation
 - Hydrodynamical simulations of self-gravitating systems
 - Simulation of X-Ray observations
 - N-Body simulations
 - Magnetorotational Instability Simulations
- Jets Simulations
- Planck Mission Simulated Data

ITVO : Institution and Working Team

- Development of the ITVO need several expert people in several fields.
 - Astronomer Team
 - S. Borgani, L. Tornatore == Univ of Trieste
 - G. Bodo == INAF Torino
 - F. Pasian, C. Vuerli == INAF Trieste
 - V. Antonuccio, A.Bonanno == INAF Catania
 - Technological Team
 - R. Smareglia, V. Manna == INAF Trieste
 - C. Gheller, P. Malfetti == CINECA
 - U. Becciani, C. Costa == INAF Catania

ITVO : Starting HW Infrastructure

- CINECA
 - IBM CLX/1024 Linux Cluster
 - 1024 cpu / 1 Tb ram / 5.5. Tb storage
 - IBM Sp5/512 Cluster
 - 512 cpu / 1.2 Tb ram / 6.9 Tb Storage
 - SGI Altix 3700
 - 64 cpu / 128 Gb ram / 2.2 Tb Storage
- INAF
 - OAAct (trigrid/COMETA)
 - ~ 1024 cpu / 1 Tb ram / 100 Tb Storage
 - OATs (beowulf systems)
 - 64 cpu / 128 Gb ram / 5 Tb Storage
 - IGI Grid Framework
