

# Applications Working Group – Closing Remarks

---

Virtual IVOA Interoperability Meeting, April 2022

Tom Donaldson and Adrian Damian (chairs)

1 session

1 hackathon

1 splinter discussion

Thanks to the presenters for very interesting content and to everyone for participating!

See the [program page](#) for notes, slides and recordings.

## Apps Session

---

### *Getting COOSYS ready for 2025* – Markus Demleitner

- Recognizes the increasing importance of communicating proper motion with positions
- Fallback approach if VODML annotations not successful in timely manner
- Discussion about where best to invest effort and not wanting to end up with multiple specs

### *MOC lib Rust and its derivatives*– François-Xavier Pineau

- Rust implementation supporting MOCs is feature-rich and highly performant
- Python, JavaScript and CLI can all utilize those features and performance!

### *Supporting Prototype Implementations in PyVO*– Omar Laurino

- Decorators directly address the question of how to keep non-standard implementation distinct
  - Users opt in to uses non-standard features.
- Well-received. Likely be merged and released soon.

## Splinter Meeting on JSON

---

Well-attended session in gathertown earlier today

Frossie outlined the case for JSON and updating our tech in general

Discussion outlined advantages to both standing pat and moving forward.

- At some level, keeping up with (or not getting too far behind) current tech is inevitable.
- But how to preserve interoperability and limit upgrade costs while that happens?

Ongoing discussion

- Links to notes and slides on the [Applications program page](#)
- Interesting threads on Slack today ([#mtg-virtual-2022](#) and [#applications](#))
- Future: Slack, mail lists, Interop
  - *Obviously a multigroup effort involving at least Apps, DAL, GWS*

# Hackathon

---

~2.5 hour block of sessions on Wednesday

## General Impressions

- The informal collaboration was useful and kind of fun
- Gathertown worked well
  - Thanks to Escape/ObAs for providing it and Hendrik Heintl for setting it up
  - Handled the small to medium sized discussions
  - Ability to easily switch among shared screens was very helpful
- Duration was a little short to really spin up on a project
- Would be interesting to try another, incorporating feedback from this one

Hack summaries...

## How to get a DatalinkResults instance for a local Datalink Table

```
from astropy.io import votable  
import pyvo
```

```
dl = pyvo.dal.adhoc.DatalinkResults(votable.parse("zw.xml"))  
print(list(dl.bysemantics("#this")))
```

```
# Sample data from:  
curl -o zw.xml "http://dc.zah.uni-heidelberg.de/gaia/q2/tsdl/dlmeta?ID=199286482883072"
```

*Participants: Alberto Micol (question), Markus Demleitner (answer),...*

# Define pyvo API for accessing VODML information in DAL results

---

## Overview of the existing code

- dove deep in the code presented by LM in DM2
- turned out that it could provide many components for a future PyVO implementation
- some issues with the automatic detection of quantities e.g. how to make sure I got the desired one

## Discussions

- Check the AstroPy classes that could be issued from the mapping readout
- Candidates:
  - For sure: AstroCoord, Time
  - Candidate: Fluxes Magnitude
  - to be investigated

## Spectral Quantity

- How specialising Quantity (Generic measure), should we have to do it?
- Refine the one2one mapping with Meas/Coord

## Home work and roadmap

- Taking some real cases of VOTable processing
- Figure out (with pseudo code) how to do the same with a mapping based stuff
- This exercise should outcome a relevant mapping-based API specification
- Next steps
  - Finding script samples
  - Collaborate on the API definition

*Participants: Laurent Michel, et al.*

## Collecting notebooks using PyVO/astroquery

---

A very productive discussion between the PyVO maintainers and notebook/downstream library authors.

We converged towards the following approach:

- It's not realistic monitoring the downstream software. For PyVO we will instead focus on increasing coverage and having a more robust CI to detect regression errors first (PRs as part of this hack-a-thon)
- We will document in the PyVO documentation for the downstream users how to test against our dev version.
- Suggestion for notebook authors to have them registered in VO like other resources.

*Participants: Brigitta Sipőcz, et al.*

# Simple Cone Search server bundle

Implement a small package to provide a ConeSearch service. To be re-used by newcomers, to test initial steps of curation and deployment.

Starting out of SCSC: **Simple Cone Search Creator** (T. Boch, python). Ported by H. Heini and T. Boch to python 3 before the hack-a-thon.

- discussed goals & ideas
- target audience, marketing purpose
- add VOTable support
- simply containerise
- try it out, maybe using a different CSV table went for containerisation...
- ended with a working Docker file and a better knowledge of tool configuration
- will continue
- polishing the container solution
- discussing it at the oncoming Newcomers Feedback meeting

## Many Ways to Participate in Apps Working Group

---

Share application news, ideas, problems

- E-mail: [apps@ivoa.net](mailto:apps@ivoa.net) ([subscribe here](#))
- Slack channels:
  - IVOA#applications ([subscribe here](#))
  - astropy#pyvo ([subscribe here](#))

Open development: File issues, comment, submit pull requests

- [VOTable standard](#)
- [PyVO](#)

# Thanks and goodbye!

Thanks to everyone for the productive and fun meetings.

Special thanks to vice-chairs Raffaele D'Abrusco and Adrian Damian!
