

URBANA CHAMPAIGN INTEROP 2012

PARAMETER DESCRIPTION LANGUAGE :

A GENERIC GRAMMAR FOR PARAMETERS (AND RELATES CONSTRAINTS) DESCRIPTION.

PRESENTING THE GENERIC CLIENT AND WORKING SERVICES

CARLO MARIA ZWÖLF,

Laboratoire d'Etude du Rayonnement
et de la Matière en Astrophysique

FRANCK LE PETIT,

PAUL HARRISON.

The University of Manchester

Introduction to PDL

- PDL is a grammar for

Describing parameters

Describe physical properties of parameters

Nature	Meaning	Unit	Precision	Range
--------	---------	------	-----------	-------

Describe complex relations involving parameters

Physical constraints	Arbitrary Conditions	Mathematical Conditions
----------------------	----------------------	-------------------------

Making *transversal* (i.e. cross standard) interoperability straightforward within all the VO components

Interaction of two services has sense if the parameter sent by the first and expected by the second have same

Computer type	Physical concept	Unit
---------------	------------------	------

Interaction of two services has sense if all preconditions of second service are satisfied by output of first one

Introduction to PDL

- PDL is a grammar for

Describing parameters

Describe physical properties of parameters

Nature	Meaning	Unit	Precision	Range
--------	---------	------	-----------	-------

Describe complex relations involving parameters

Physical constraints	Arbitrary Conditions	Mathematical Conditions
----------------------	----------------------	-------------------------

Making *transversal* (i.e. cross standard) interoperability straightforward within all the VO component

Interaction of two services has sense if the parameter sent by the first and expected by the second have same

Computer type	Physical concept	Unit
---------------	------------------	------

Interaction of two services has sense if all preconditions of second service are satisfied by output of first one

Indeed PDL capabilities meet:

- The “*scientific*” description needs
- The “*scientific*” interoperability needs

- Using PDL one could describe
 - All the mathematical constraints on params
 - All the possible conditional sentences
- PDL Descriptions
 - Can be understood easily by humans
 - Can be interpreted and handled by a computer

- Concepts and Details will be presented in GWS session.
- PDL standard working draft available at pdl.obspm.fr

PDL main corollary

Since parameters are finely described with fine grained granularity

- Interoperability becomes possible in the *smart* sense we need
- Dynamic interactive graphical client can be automatically generated from description
- Checking algorithms for validating data can be automatically generated from description

PDL main corollary

Since parameters are finely described with fine grained granularity

- Interoperability becomes possible in the *smart* sense we need
- Dynamic interactive graphical client can be automatically generated from description
- Checking algorithms for validating data can be automatically generated from description

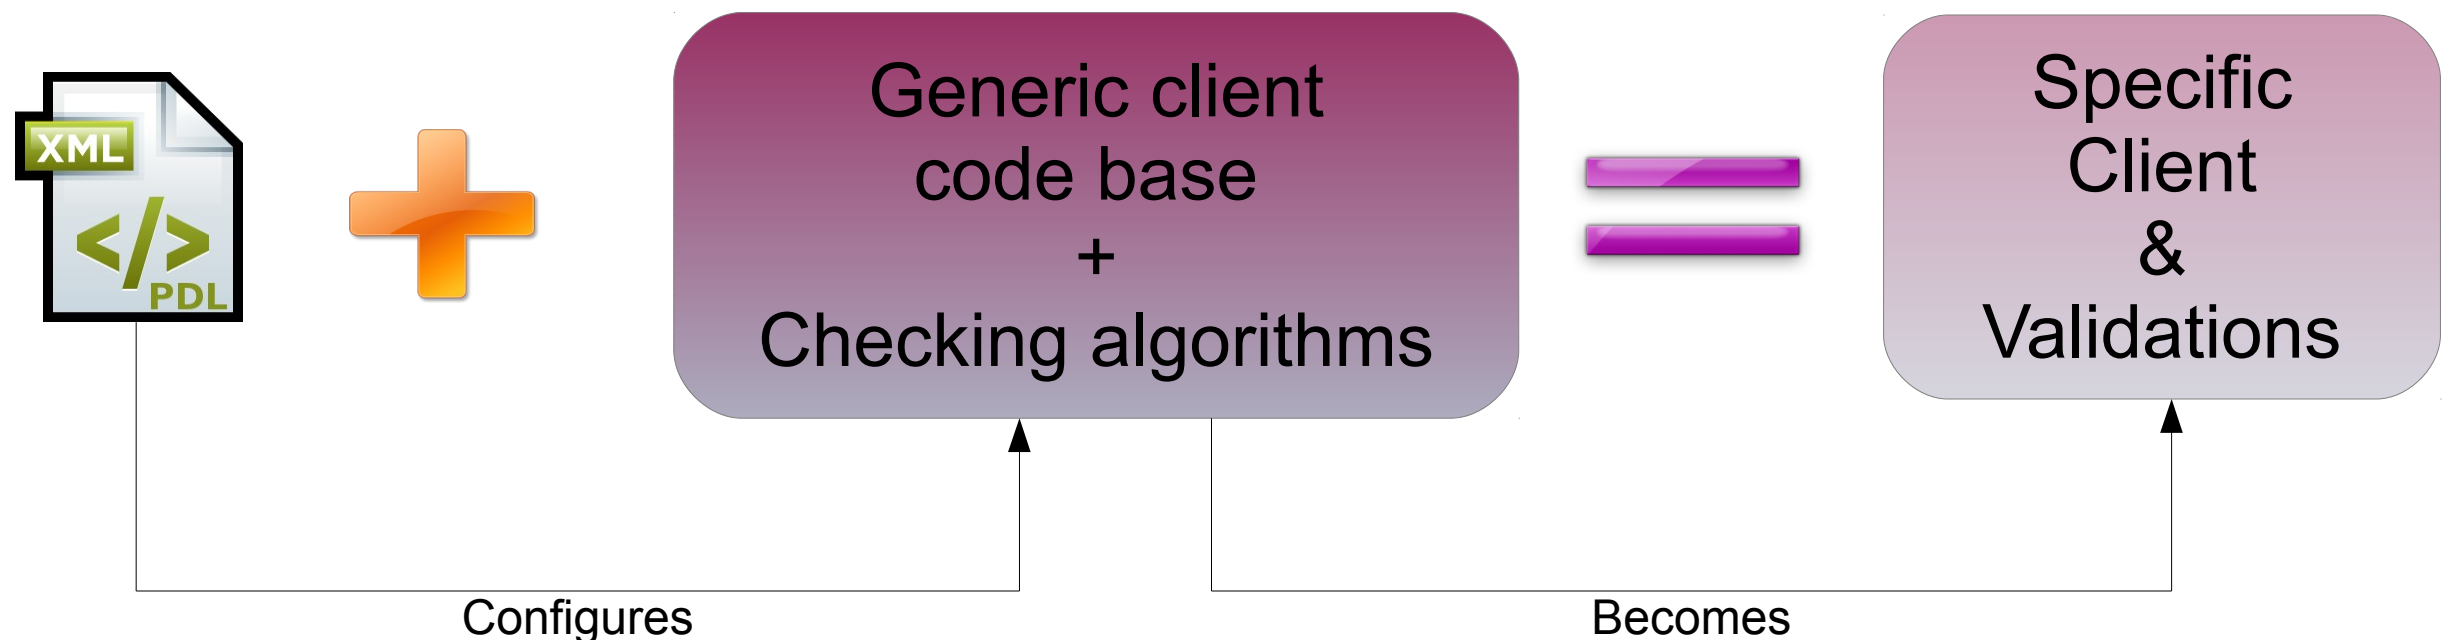

- Generic client can be *configured* on the fly using PDL description

PDL main corollary

Since parameters are finely described with fine grained granularity

- Interoperability becomes possible in the *smart* sense we need
- Dynamic interactive graphical client can be automatically generated from description
- Checking algorithms for validating data can be automatically generated from description

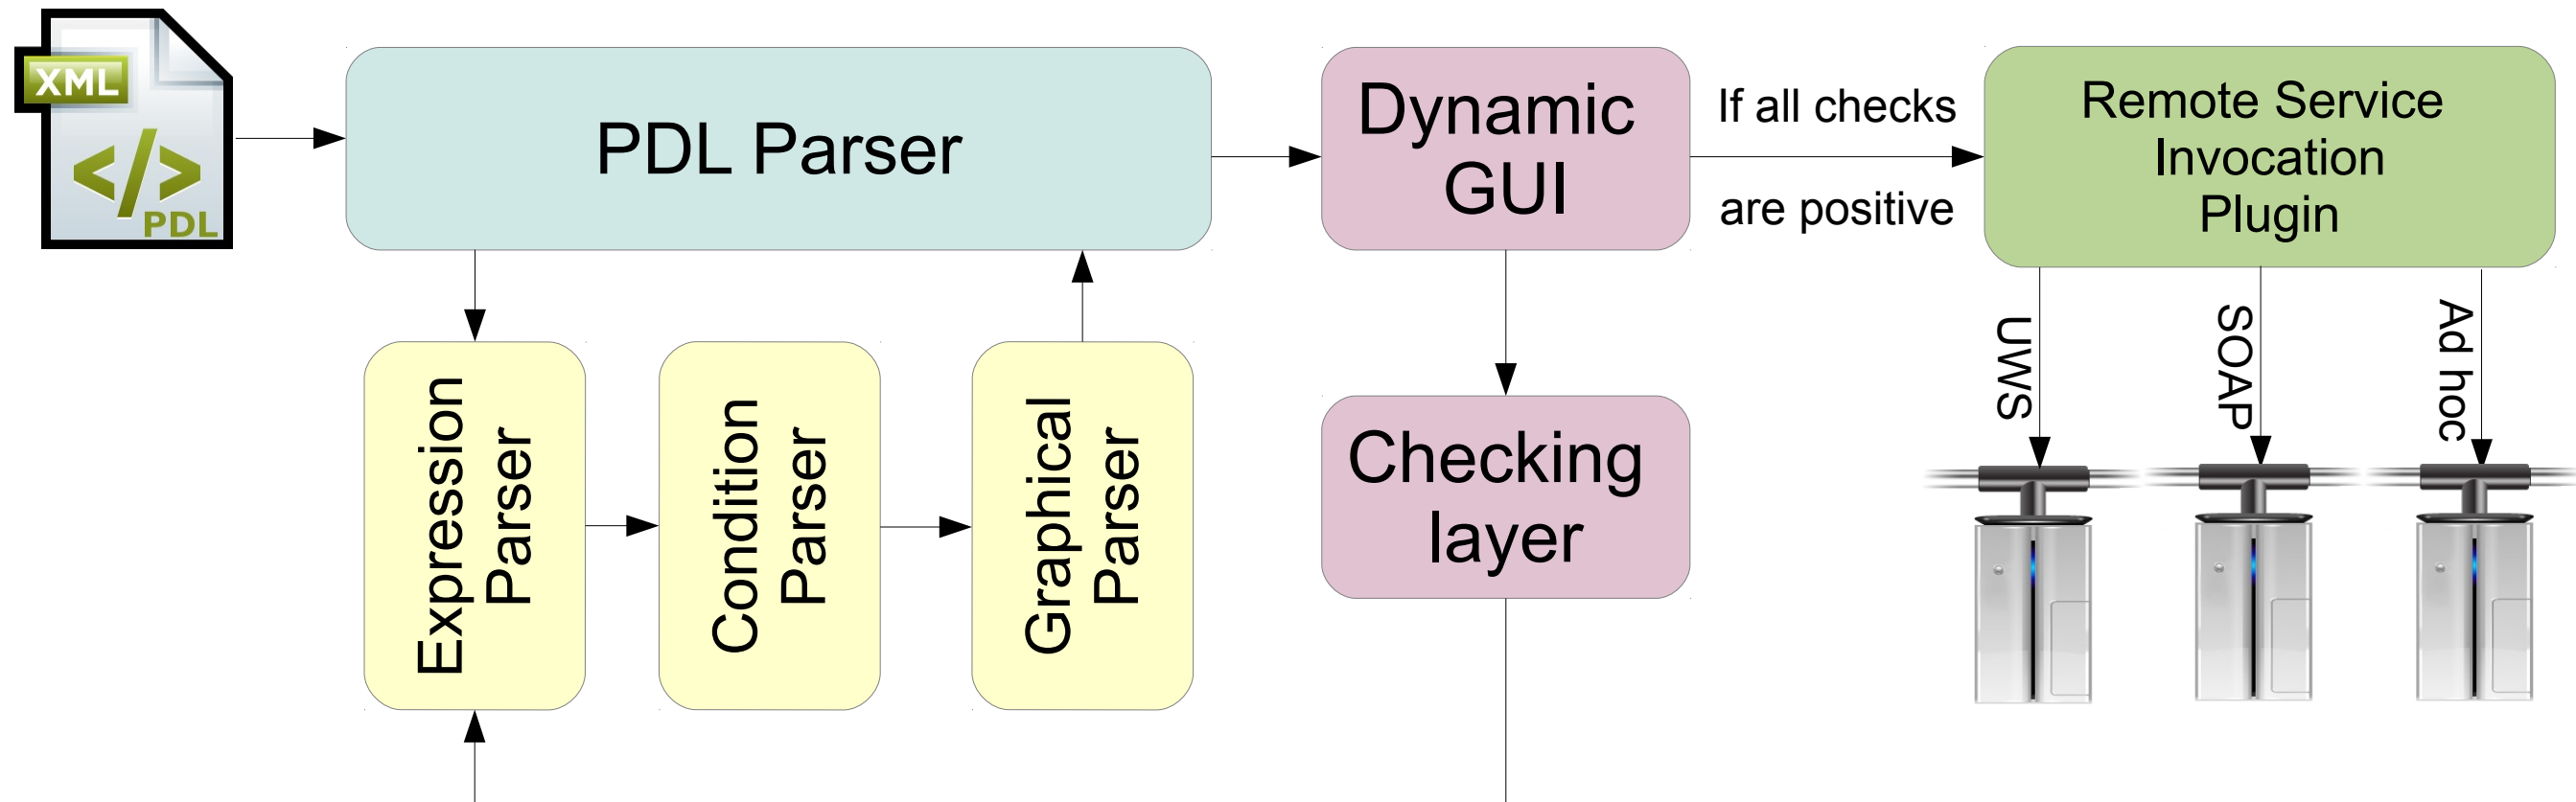

Some Statistics on code	
Lines of code	~ 10 000 total ~ 3 000 automatically generated
Classes	128
Methods	835

Dynamic client & Checking layer software architectures

Dynamic client & Checking layer software architectures

Major difficulty we have to deal with:

PDL sentences

- Could be very complex;
- Could have an arbitrary (non predictable) number of elements.

Dynamic client & Checking layer software architectures

Major difficulty we have to deal with:

PDL sentences

- Could be very complex;
- Could have an arbitrary (non predictable) number of elements.

- All the Parsers are based on *Neuron Network* algorithms
- These are implemented using factory patterns
- The parser itself build the ad-hoc network for parsing the expression
- Every neuron performs an atomic interpretation

The existing services

PDR CODE PDR DATABASE PDR TOOLS TIPS DOCUMENTATIONS CREDITS

The Meudon PDR code

Description

The **Meudon PDR code** computes the atomic and molecular structure of interstellar clouds.

The code considers a stationary plane-parallel slab of gas and dust illuminated by a radiation field coming from one or both sides of the cloud. The incident radiation field can be the Interstellar Standard Radiation Field (ISRF) and/or a star.

It solves at each point in the cloud, the radiative transfer in the UV taking into account the absorption in the continuum by dust and in discrete transitions of H and H₂. The model computes the thermal balance taking into account heating processes such as the photoelectric effect on dust, chemistry, cosmic rays, etc. and cooling resulting from infrared and millimeter emission of the abundant species. Chemistry is solved for any number of species and reactions.

Use the Meudon PDR code

October 2011 : Release of **PDR code version 1.4.3**

- [Download](#) and install the code

Recent changes : **Mon, 06 Feb 2012**
Latest revision : **662**

- [Follow recent modifications on the track](#)

Chemistry

The existing services

Three existing services are exposed using the PDL framework

- The Meudon PDR Code
- The opacity table service from the *Opacity Project*

The Iron Project - The Opacity Project

IPOPv2

Home	The Opacity Project	The Iron Project	TOPbase	TIPbase	OPserver	OP tables	Contact
------	---------------------	------------------	---------	---------	----------	-----------	---------

The Opacity Project - The Iron Project

The names Opacity Project (OP) and Iron Project (OP) refer to an international collaboration that was formed in 1984 to calculate the extensive atomic data required to estimate stellar envelope opacities and to compute Rosseland mean opacities and other related quantities. It involved research groups from France, Germany, the United Kingdom, the United States and Venezuela. The approach adopted by the OP to calculate opacities is based on a new formalism of the equation of state and on the computation by ab initio methods of accurate atomic properties such as energy levels, f-values and photoionization cross sections. The OP final results are discussed by Seaton et al.

About us - List of members

Badnell Nigel, Ballance Connor, Bautista Manuel, Burke Phil, Butler Keith, Chen GuoXin, Delahaye Franck, Del Zanna Giulio, Eissner Werner, Fivet Vanessa, Hudson Claire, Liang Guiyun, Mason Helen, McLaughlin Brendan, Mendoza Claudio, Montenegro Max, Nahar Sultana, Oelgoetz Justin, Palmeri Patrick, Pradhan Anil, Quinet Pascal, Ramsbottom Cathy, Saraph Hannelore, Storey Peter, Wasson Ian, Withoef Mike, Zeppen Claude,

The existing services

Three existing services are exposed using the PDL framework

- The Meudon PDR Code online
- The opacity table service from the *Opacity Project*
- The Meudon Broadening Stark H computation service

Hydrogen Stark broadening calculation for astrophysical applications

The Stark line profiles are calculated using the Model Microfield Method of Brissaud and Frisch (J. Quant. Spectrosc. Rad. Transfer 11, 1767 (1971)) which allows to include in a natural way the effects of the motions of the plasmas ions.

Parameters

Email :	<input type="text"/>
Initial level :	<input type="text"/>
Final level :	<input type="text"/>
Temperature :	<input type="text"/>
Density :	<input type="text"/>

The parameters must verify the Debye approximation : $0.09 * N_e(\text{cm}^{-3})^{1/6} / T(\text{K})^{1/2} < 1$

Allowed Parameters in N_e & T
(grey zone corresponds to the condition : $r_0 < \text{Debye}$)

The existing services

Three existing services are exposed using the PDL framework

- The Meudon PDR Code online
- The opacity table service from the *Opacity Project*
- The Meudon Broadening Stark H computation service

For these services

- Computations are remotely driven using Java Servlet technologies
- Results
 - are “*buffered*” for avoiding expensive recalculations
 - are sent by e-mail to user

The PDL remote service invocation plugin call the servlet with the parameters coming from the PDL client
