

SourceDM: Status and VO/DML

Jesús Salgado - *ESAC Science Data Center (ESDC)*

Laurent Michel
Markus Demleitner
Mark Cresitello-Dittmar

Issue/Revision: 1.0

Reference: Gaia Archive

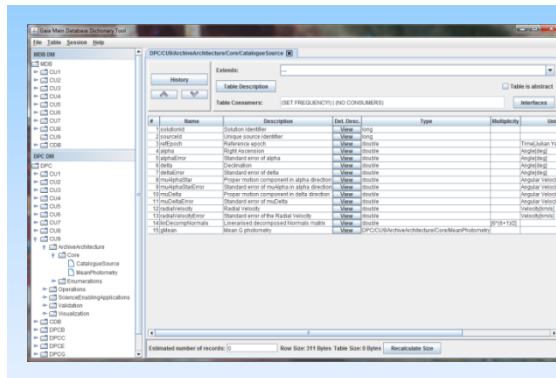

Status: Issued

ESA UNCLASSIFIED - Releasable to the Public

1. Objective:

- a. Create a simple (but useful) SourceDM definition that could help in the publishing of catalogues through VO protocols
- b. Support on the definition for catalogues metadata for near-future missions (e.g. Gaia, Euclid,...) and allow the mapping for old ones
- c. Support interoperability operations between catalogues (SED creation, crossmatch operations, etc)

Gaia: DM in the core

```

```

- VO-DML Annotations in TAP_SCHEMA?
- Different structure?

Identities

- Are two sources of different catalogues the same astronomical object?

Crossmatching

- Are two measurements of two catalogues comparable to implement complex crossmatch functions (e.g. Bayesian)?

Native Frames

- Can we annotate properly the geometrical information? Native Frames? Epochs? Correlations?

Precise Astrometry

- Can we annotate with the relevant level of detail astrometry from catalogues? (radial velocity, position of the observer,...)

Annotation

- Old catalogues are difficult to characterize. Information is found in documentation but this is difficult to be used for interoperability. Are we providing standards to annotate them?
- **Source type, Position, Radial Velocity, Proper motion, Parallax/distance, Classification, Photometry, Redshift**

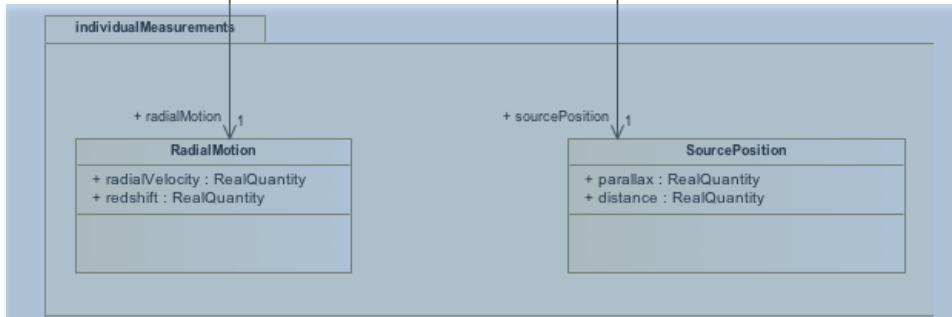

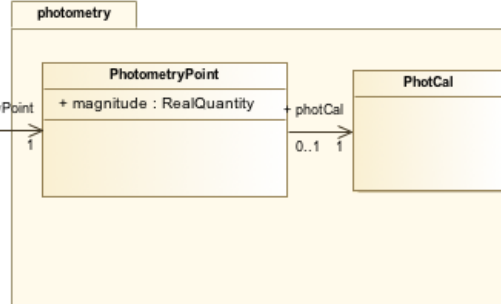

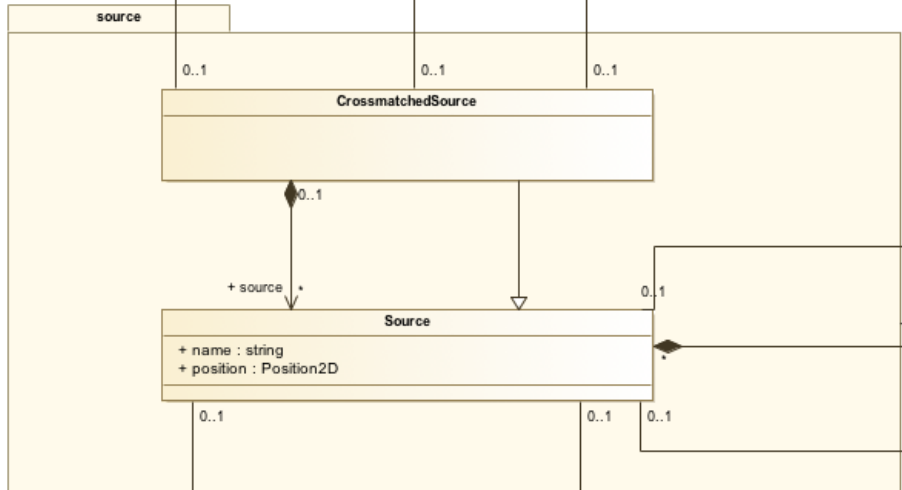

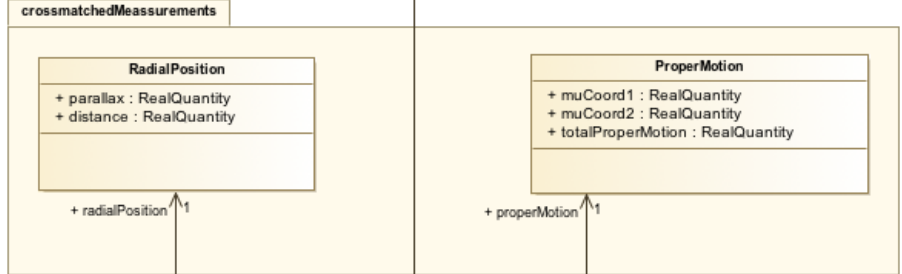

- ◆ Colors or even SEDs from photometry points
- ◆ Proper motions or even orbits from positional measurements
- ◆ Time series from, say, radial velocity measurements

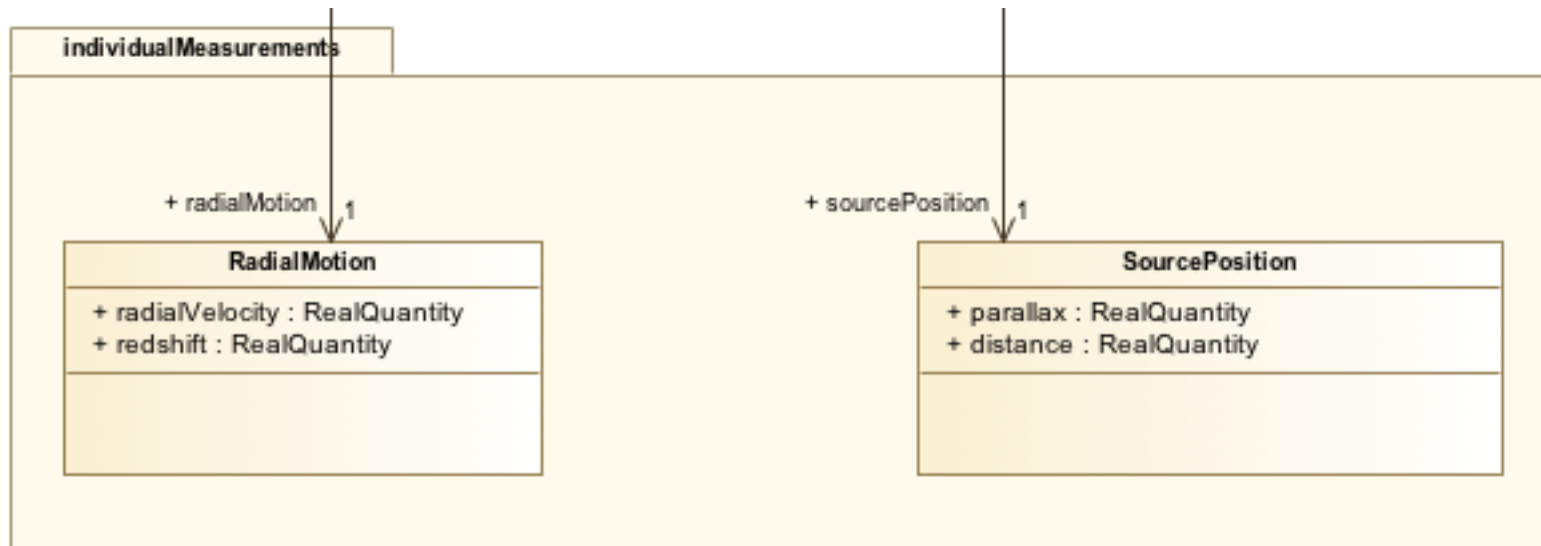

Precise Astrometry: Correlations

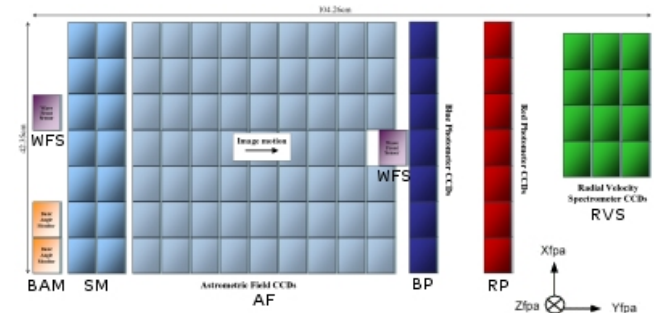

Holl et al, 2010

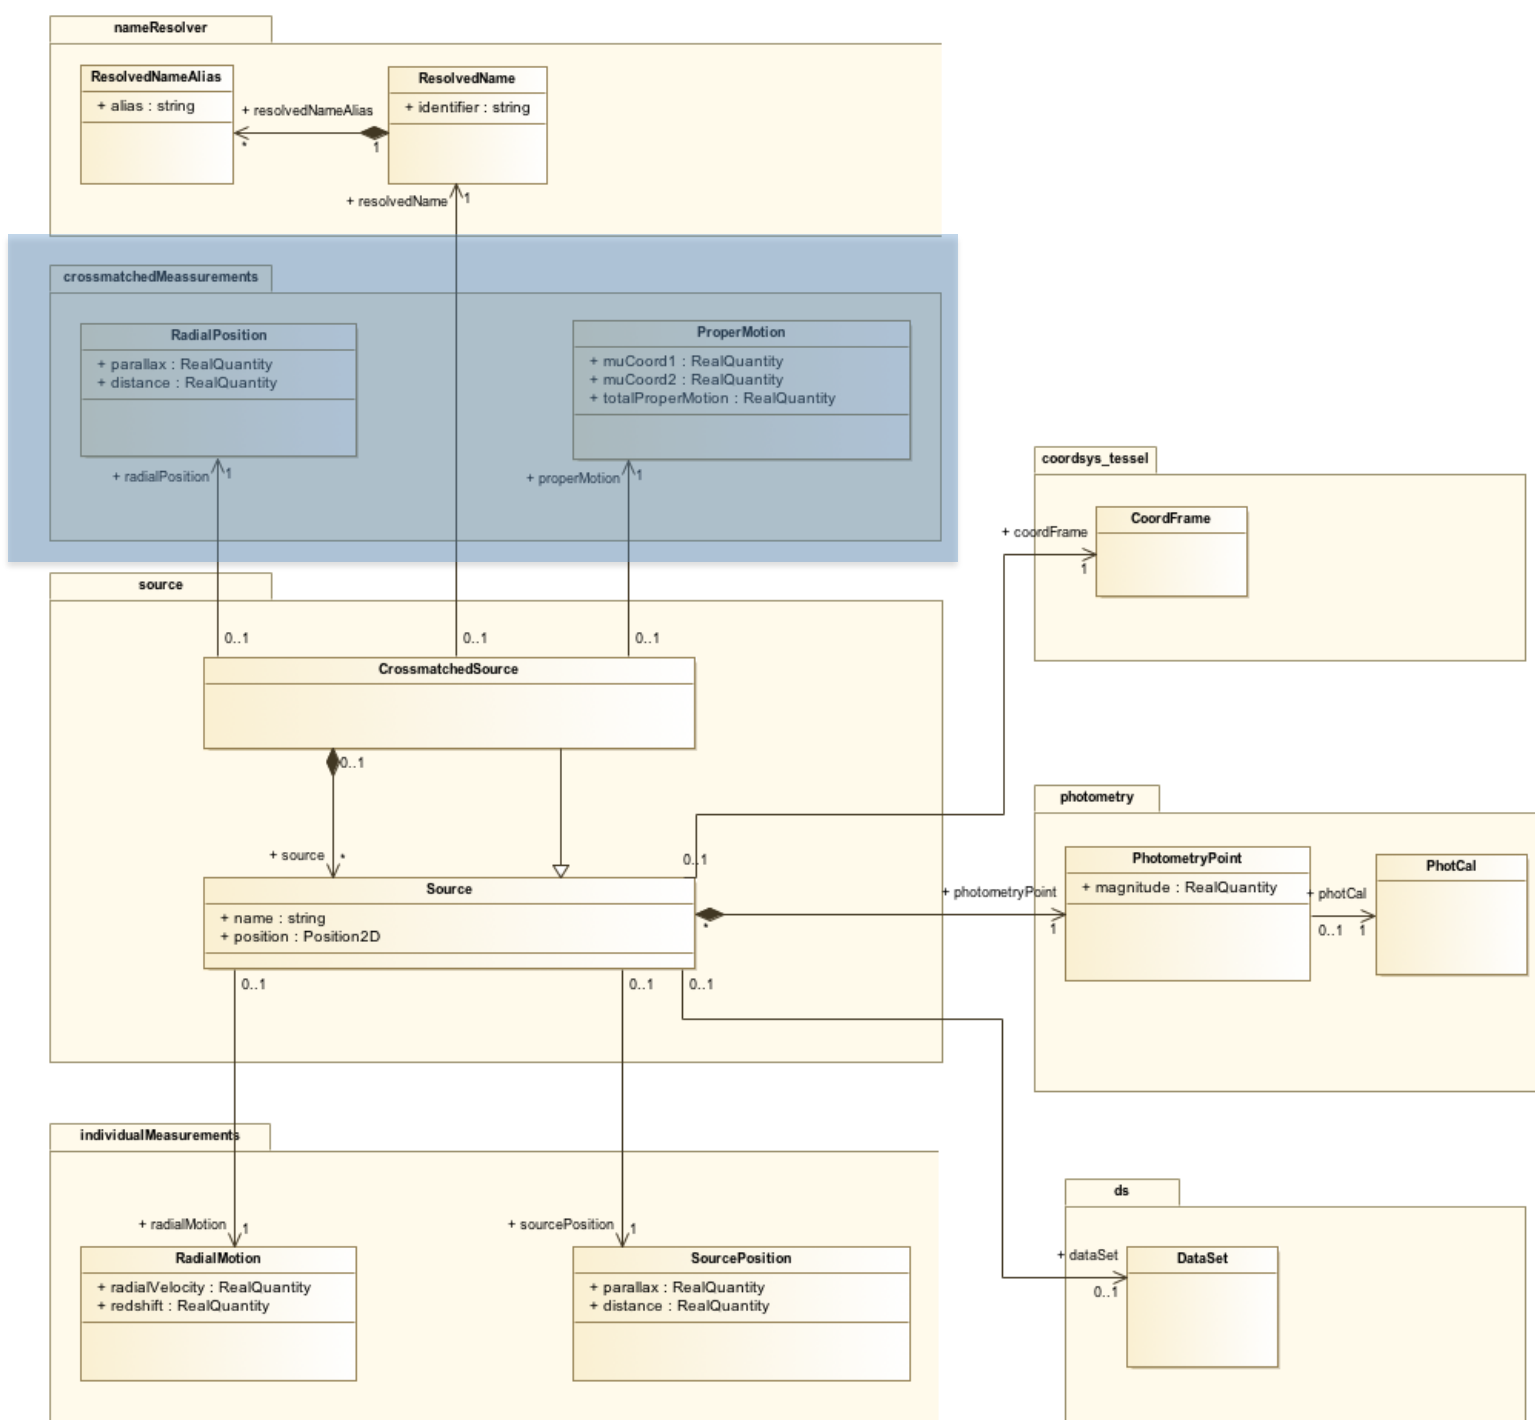

Individual Measurements

- Radial velocity usually measured due to spectroscopic analysis
- Combination of the object radial velocity and cosmological redshifts

Crossmatched Measurements

Conversion from parallaxes to distance requires certain assumptions
Parallaxes are preferred as a closer concept to a measurement quantity

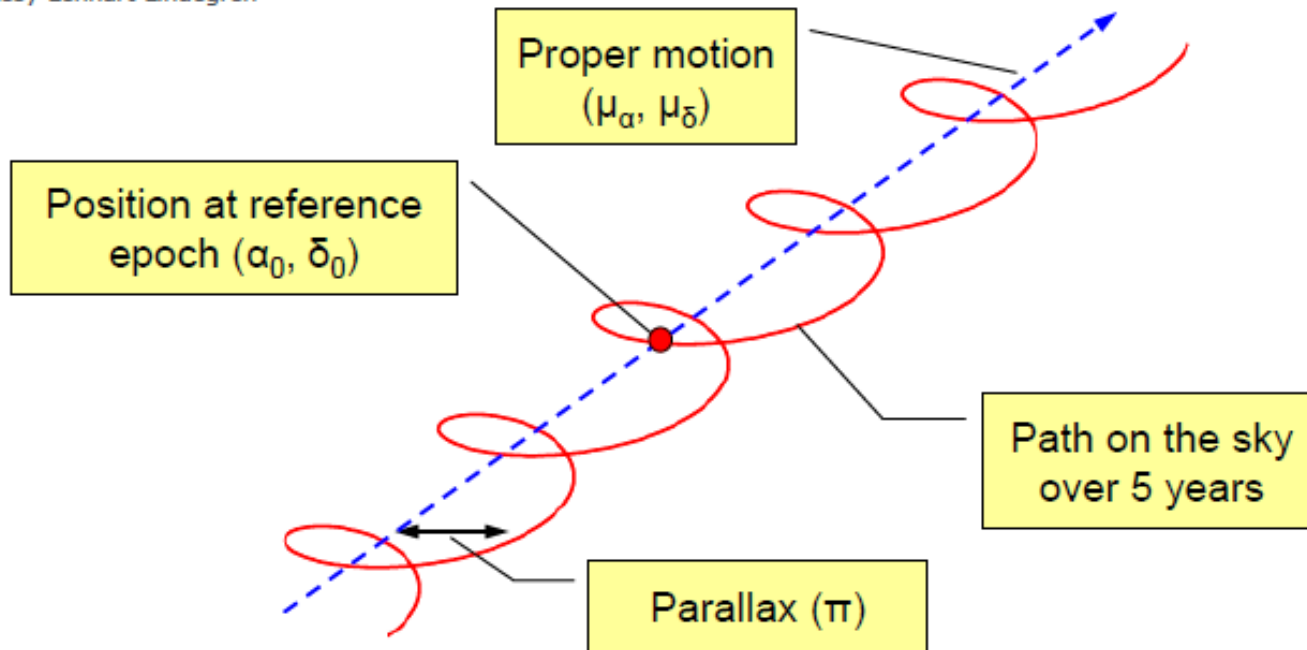

$$d=1/\rho$$

Where ρ is the parallax angle expressed in arcseconds that produce a distance in parsecs.

Crossmatched Measurements (II)

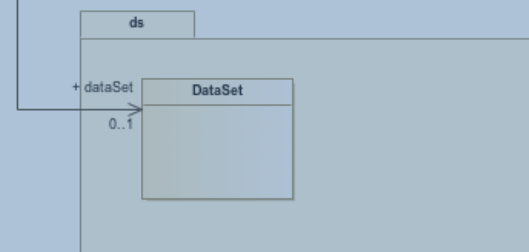

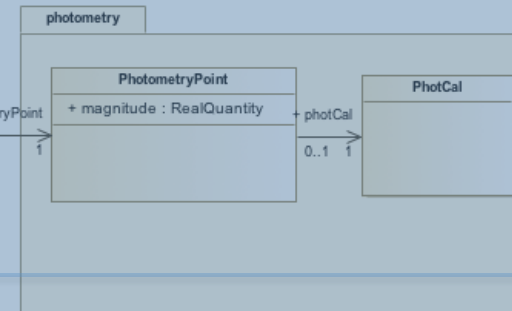

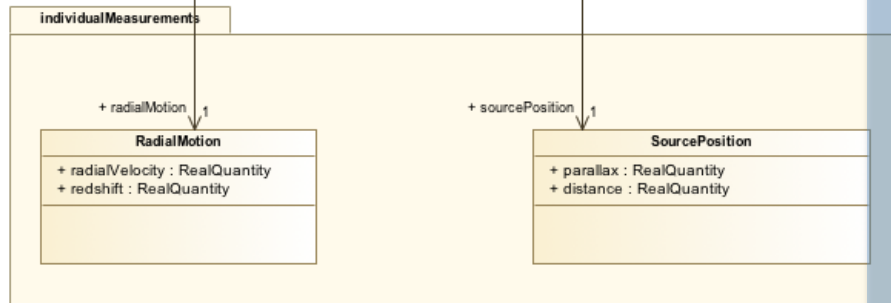

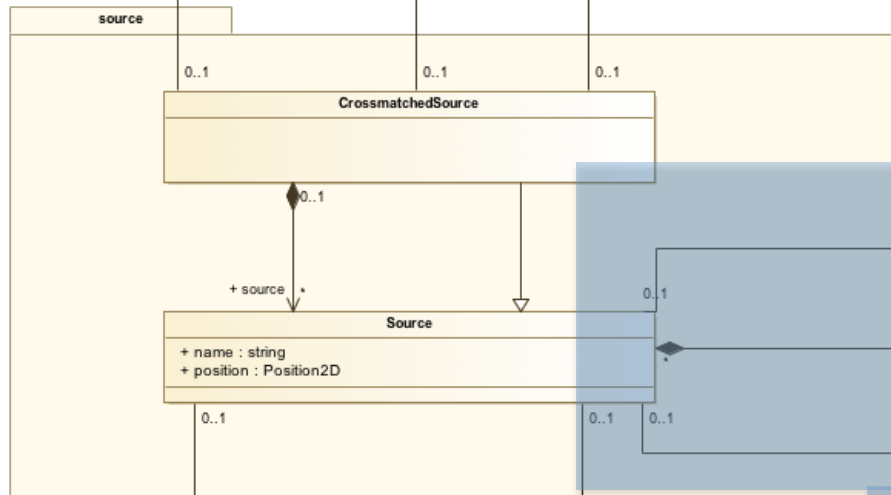

Figure courtesy Lennart Lindegren

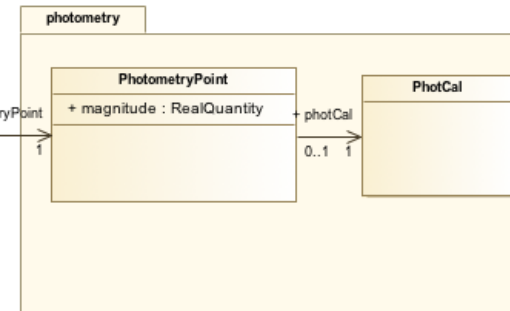

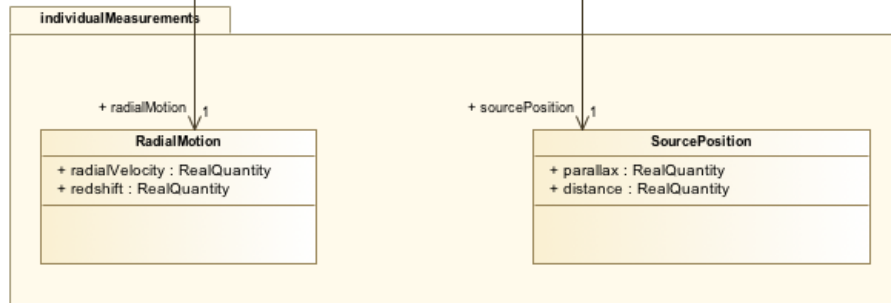

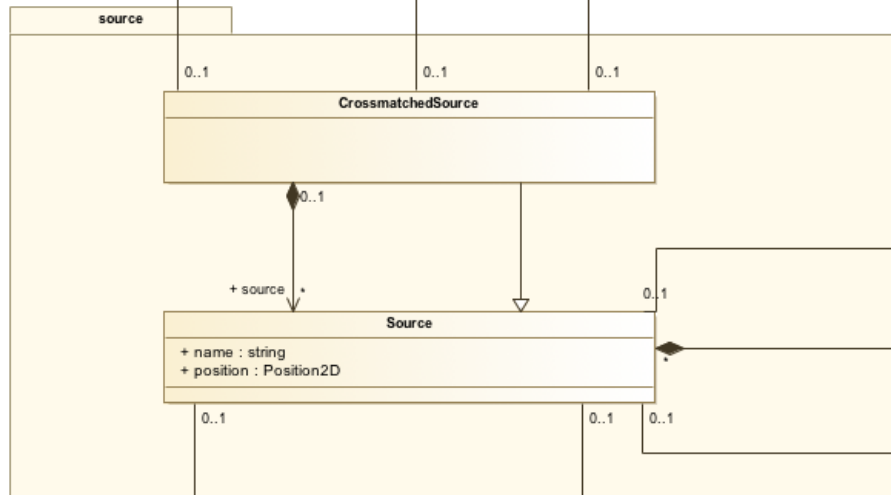

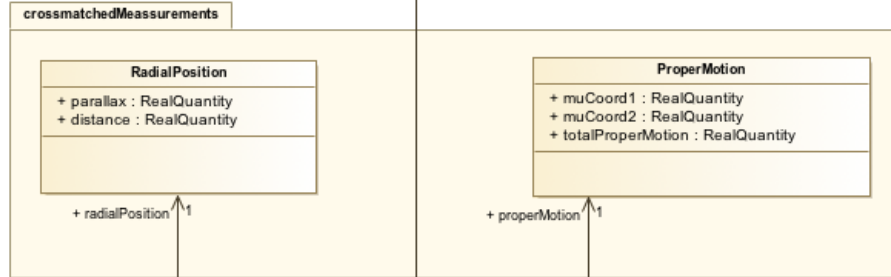

Monitor this path for 10^9 stars during 5 years and fit, for each object, a 5-parameter model to retrieve reference position, proper motion, and parallax (for a “given” instrument calibration and attitude)

$$pm \downarrow \alpha = \Delta \alpha / \cos(\delta)$$

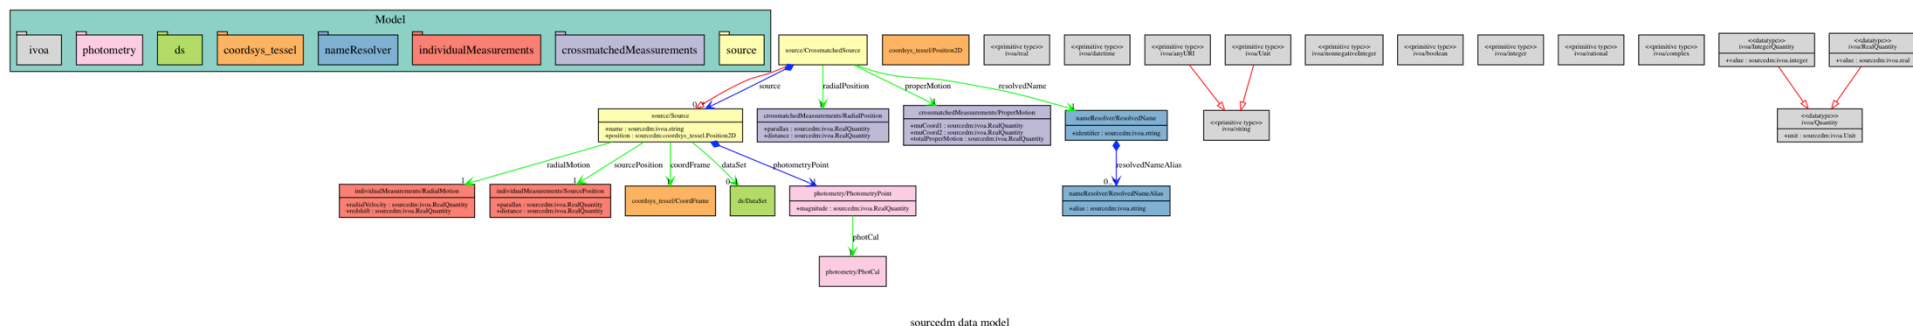

$$pm \downarrow \delta = \Delta \delta$$

1. Most of the catalogues are connected to luminosities through magnitudes/ fluxes
2. Photometric values are usually represented by:
 - a. Magnitude value and error
 - b. Photometric system description
 - c. Zero point
 - d. Link to transmission curve
 - e. Colours?
3. Flux values are usually represented by:
 - a. Flux value and error
 - b. Spectral coverage
4. Include PhotometryPoint as direct element from PhotometryDM
5. More complex connections by link to SpectralDM 2.0
 - a. Spectra
 - b. Time Series

1. Exercise to migrate data model to Modelio and generate the VO/DML documentation
2. Some vulnerabilities found during the process
 - a. XMI version not supported due to version date
 - (e.g. sed s/20110701/20100901/ sourcedm.xmi)
 - b. Really appreciated by the notes created by Laurent Michel et al
3. SourceDM

Conclusions

- First version of the VO/DML model created
- Maintain doc version and VO/DML models in line
- Exercise to map DR2 Gaia catalogue (CatalogueSource) to the IVOA Source DM
- Modify Gaia Archive TAP+ component to include VO/DML preamble with SourceDM metadata
- Agree with other catalogue providers on independent implementation

Thanks!
