

A (very) Chandra-centric path to Multi-Order Coverage maps

Raffaele D'Abrusco

SAO/CXC

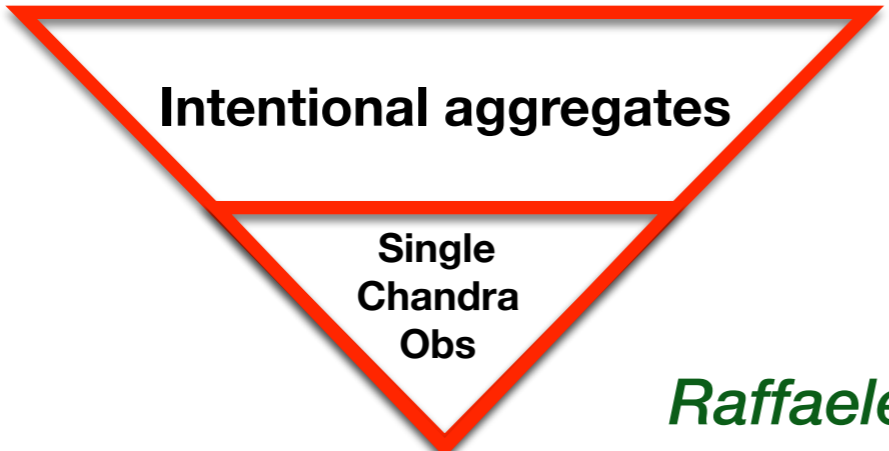

We decided to produce MOCs for Chandra archival data for very **selfish reasons** that have little to do with sharing our data and everything to do with our **Chandra ecosystem**

Growing archive

Changing demographics

New tools

The growth in **size** and **complexity** of **Chandra archival data** calls for new ways to provide descriptions of the global properties of the data in the archive at all levels of aggregation

Goals

Raffaele D'Abrusco

- ➔ Facilitate comparison with coverage of other missions (XMM, HST, Spitzer)
- ➔ Provide a global representation of the **Chandra coverage**
 - ➔ Small total footprint (< 2.2 square degrees)
 - ➔ Complex, sparse, inhomogeneous collection of irregular patches
- ➔ Avoid inefficient usage of other Chandra interfaces
- ➔ “Experimental” project
 - ➔ Small scale, quick (?), minimal impact
 - ➔ Gauge community response for future plan
 - ➔ Lightweight precursor to **Chandra HiPS**, currently in production

Results 1- 9 results per page

- ➔ Anomalous spikes of heavy usage of SIA service installed on the FPS server
- ➔ Very similar to DoS attacks
- ➔ “Culprits” were identified
- ➔ **Legitimate massive spatial queries**
- ➔ Millions of positions searched, few hundreds returned data
- ➔ **Very inefficient usage of interfaces**

How we produce MOCs

Raffaele D'Abrusco

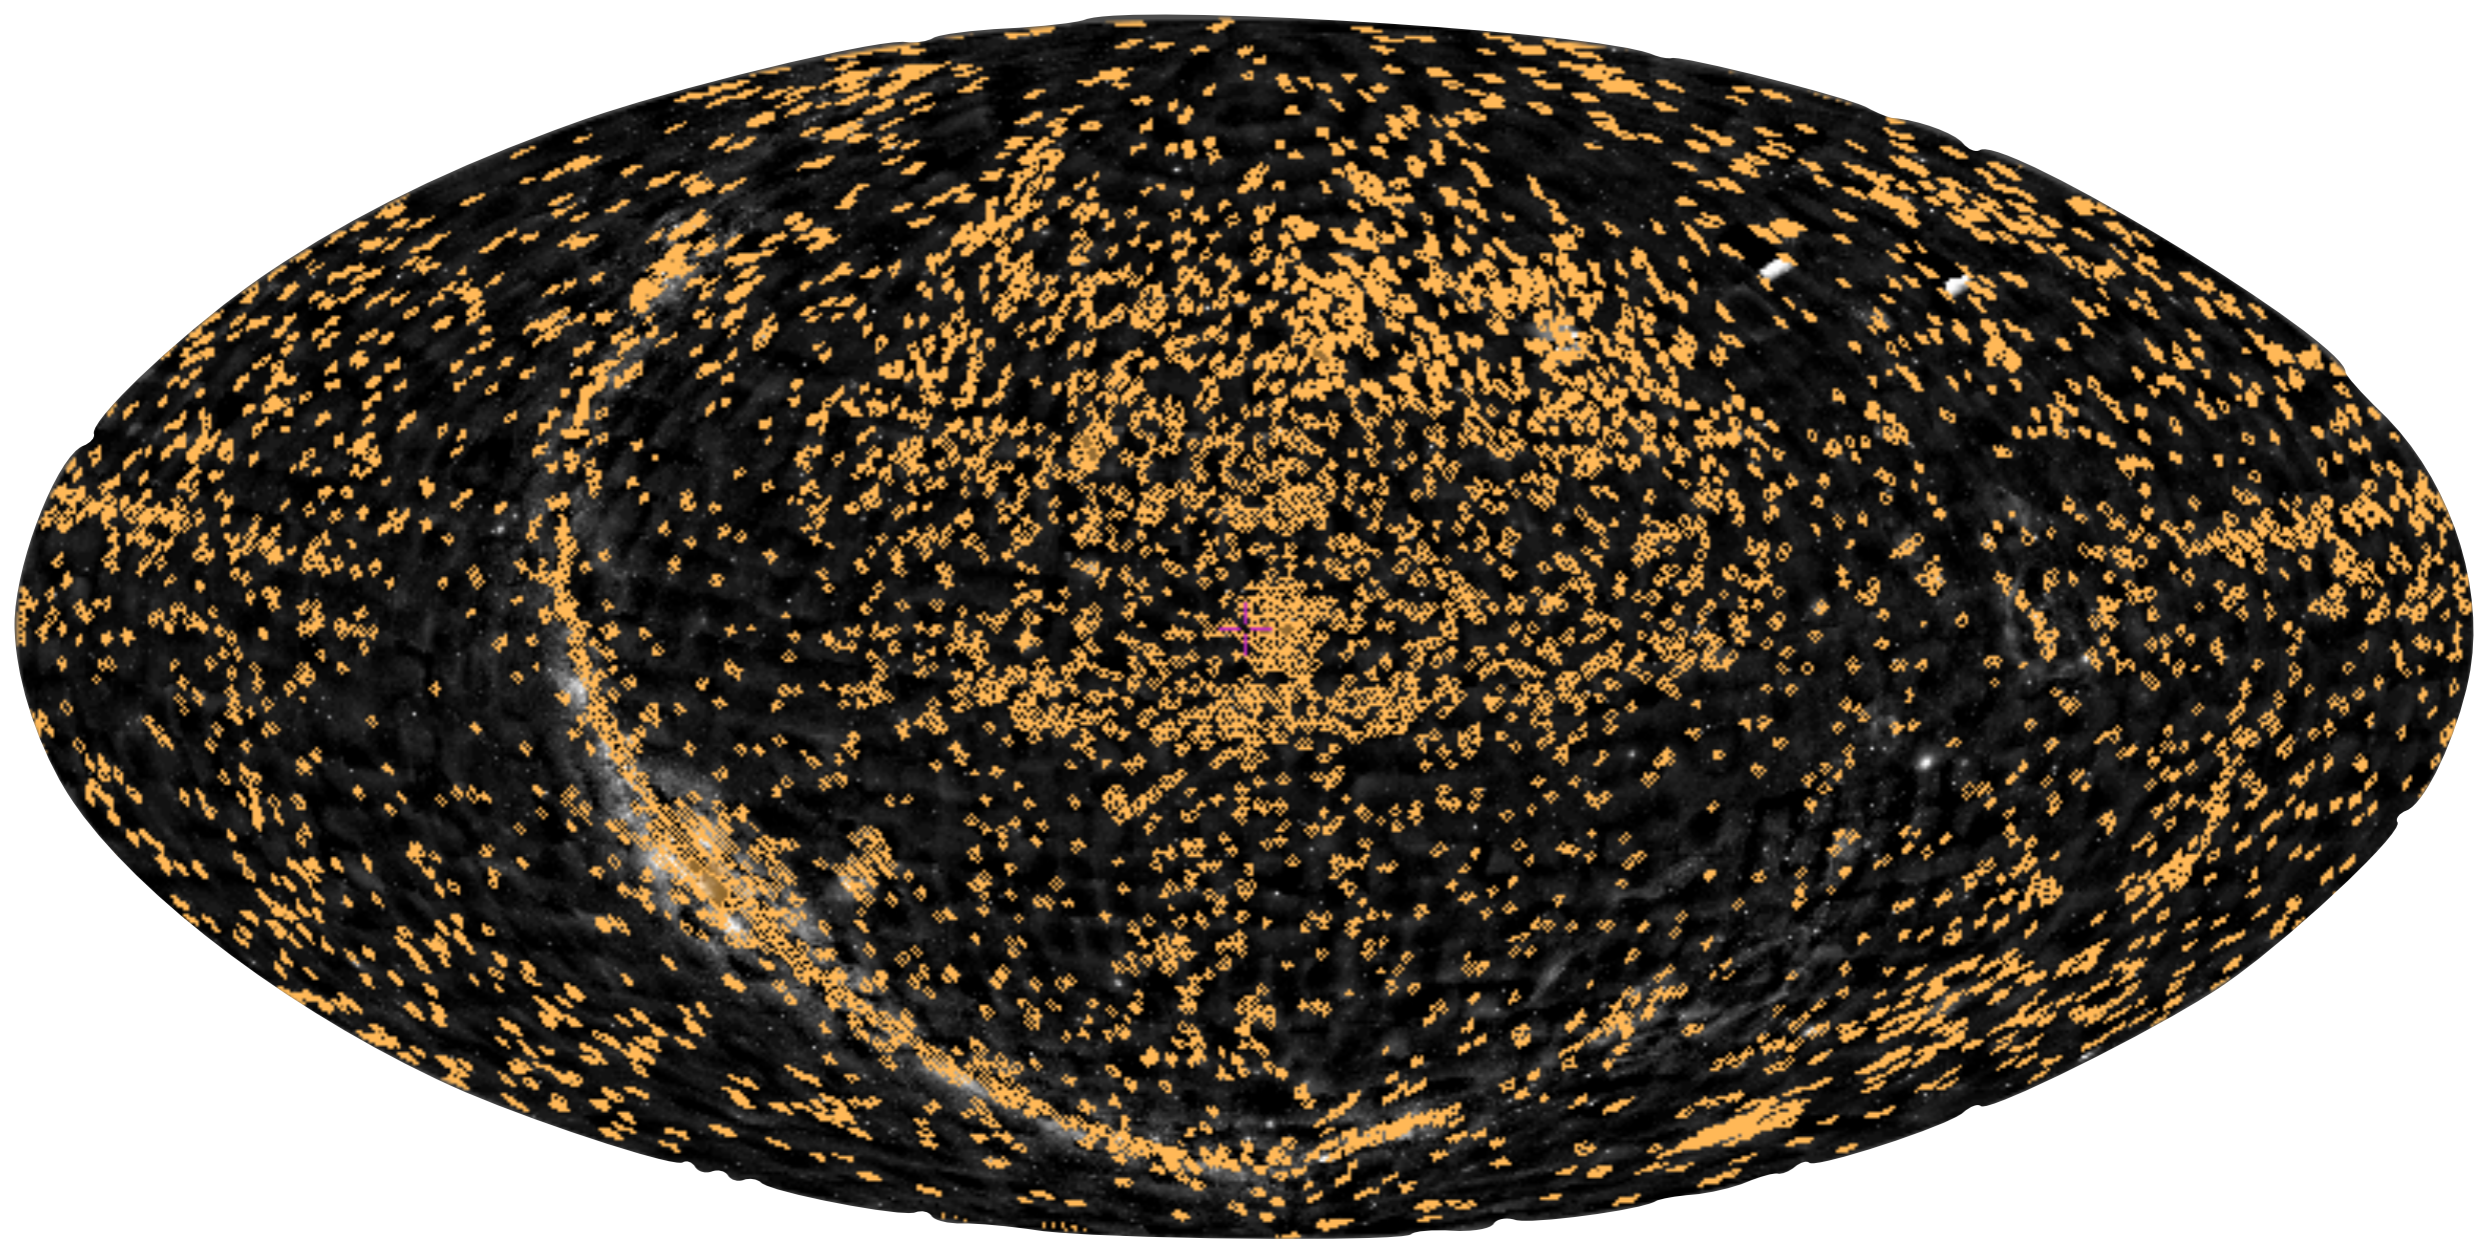

- ➔ Input from STC polygon descriptions of single chips used for each Chandra observations
 - ➔ Easily accessible information from our databases
 - ➔ **Aladin** in command line mode to create/update the MOCs
 - ➔ STILTS used to validate the new MOCs
- ➔ Distinct MOCs for imaging (HRC & ACIS) and gratings (HETG & LETG) observations
 - ➔ Footprint information for grating observations still useful for reference
- ➔ MOCs for Chandra Source Catalog (1.1 and soon 2)
 - ➔ Static (one time-off) MOCs
 - ➔ Observations included are selected based on more complex set of criteria

- ➔ **Weekly updates to the MOCs**
 - ➔ newly public Chandra observations are incorporated every week
 - ➔ additional coverage can vary between 0 and ~ 0.3 square degrees per week

- ➔ **Same MOC at different max spatial resolutions**
 - ➔ MOC orders 10 (smallest cell resolution $\sim 3.4'$) to 13 ($\sim 25.7''$)
 - ➔ Choice based to roughly approximate Chandra spatial resolution
 - ➔ Rethinking some of our choices based on users' feedback (see later)

FOR THE PUBLIC

CXC → CDA → The Archive → Chandra MOCs

INTRODUCING THE CHANDRA MOCs

The CDA produces Multi-Order Coverage maps based on *Chandra* observations:

- [What is a MOC?](#)
- [How can I use the Chandra MOCs?](#)
- [MOC-compatible software](#)
- [Chandra MOCs download](#)

Sky coverage of all public *Chandra* observations (see [description](#)) is displayed in the [Aladin Lite](#) window below using a **Multi-Order Coverage map (MOC)** derived from public *Chandra* observations with MOC order 13 (see [later](#)). Users may pan across this projection and zoom in and out using a mouse. The visualization allows a choice of coordinate systems (drop-down menu, upper left corner), a range of background images (stacked layers icon), and jumping to specific locations on the sky using coordinates or an object name (magnifying glass icon). More advanced uses of MOC maps are described [below](#).

CDA STATUS

The archive is fully functional.

REPROCESSING STATUS

Reprocessing has been completed for
Phase I: 2005-11-13 to 2011-12-31
Phase II: 2000-01-30 to 2005-11-13

CURRENT SOFTWARE RELEASES

ASCDSVER: 10.6
CALDBVER: 4.7.8

WHAT'S NEW

Chandra Footprint Service
2018-05-14
The new secure Footprint Service can be found [here](#)

Global Chandra Coverage
2018-02-14

Raffaele D'Abrusco

- ➔ **What are MOCs?**
- ➔ **Visualization** catches the eye...
 - ➔ Aladin Lite Javascript widget (thanks Thomas!) embedded in the webpage
- ➔ ...but MOCs are useful in multiple ways
 - ➔ 2 step-by-step write-ups of usage scenarios that makes sense for Chandra community
 - ➔ providing some details on how to **filter lists of coordinates** with MOCs (*inMOC()*, *nearMOC()* STILTS functions) or perform **logical operations on multiple MOCs** (Aladin)
- ➔ Introducing MOC-compatible tools
 - ➔ promote tools and libraries that work with MOCs (**Aladin, Topcat, MOCpy, PyMOC**)

Early users' feedback

Raffaele D'Abrusco

→ Overall positive reception

- Most first time users found **MOCs useful** and “cool”
- Correlation with seniority: younger researchers tend to know MOCs and/or are willing to use them more often than experienced researchers
- Rethinking MOCs orders based on feedback
- Requests for deeper integration with Chandra public interfaces
- Users would love if MOCs carried additional information (i.e., list of observations contributing to each cell)

→ Specific questions

- “Can MOCs be read in DS9?”
- “**Where are the Chandra HiPS?!?!!!!!**”
- “Can you get me a special MOC based on a collection of observations of my choice?”

What's next

- ➔ Making Chandra MOCs available everywhere
- ➔ Chandra HiPS
- ➔ Pursuing deeper integration of Chandra MOCs/HiPS into our Chandra public interfaces
