VODataService 1.2 in RegTAP

Content

With VODataService 1.2 in RFC, the question of how to map it into RegTAP to actually make the additional metadata useful for discovery becomes urgent. In this talk, I will present the `rr.stc_X` tables that have been used on `reg.g-vo.org` during the development of VODataService 1.2, together with ADQL extensions required to enable powerful queries on this data.

Preferred talk time

daytime CET
