

# Exploring astronomy data archives at scale using deep learning and crowdsourcing

**Sandor Kruk**  
Data Scientist, European Space Agency

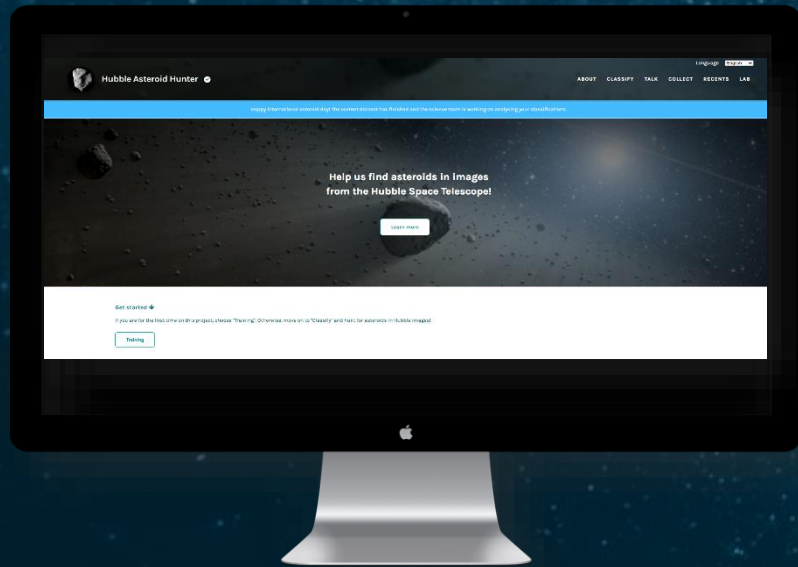

Bruno Merín, Rachana Bhatawdekar, Deborah Baines, Elena Racero, Pablo García Martín, Marcel Popescu, Max Mahlke, Benoît Carry, Ross Thomson, Samet Karadag, Guido de Marchi, Emily Garvin, Claude Cornen, Ben Aussel, Megan Perks, Steven Dillman, Tamina Lund, Mark McCaughrean

09/05/2023

# AI and crowdsourcing for knowledge discovery

“Knowledge Discovery is the task of **processing and analysing astronomical datasets** with the aim of extracting **new knowledge**. This endeavour spans multiple disciplines including **visualisation, data access and exploration, machine learning**, statistical methods and workflow orchestration.”

## Exploration: crowdsourcing

## ML: Deep learning

## Large astronomical archives: eHST

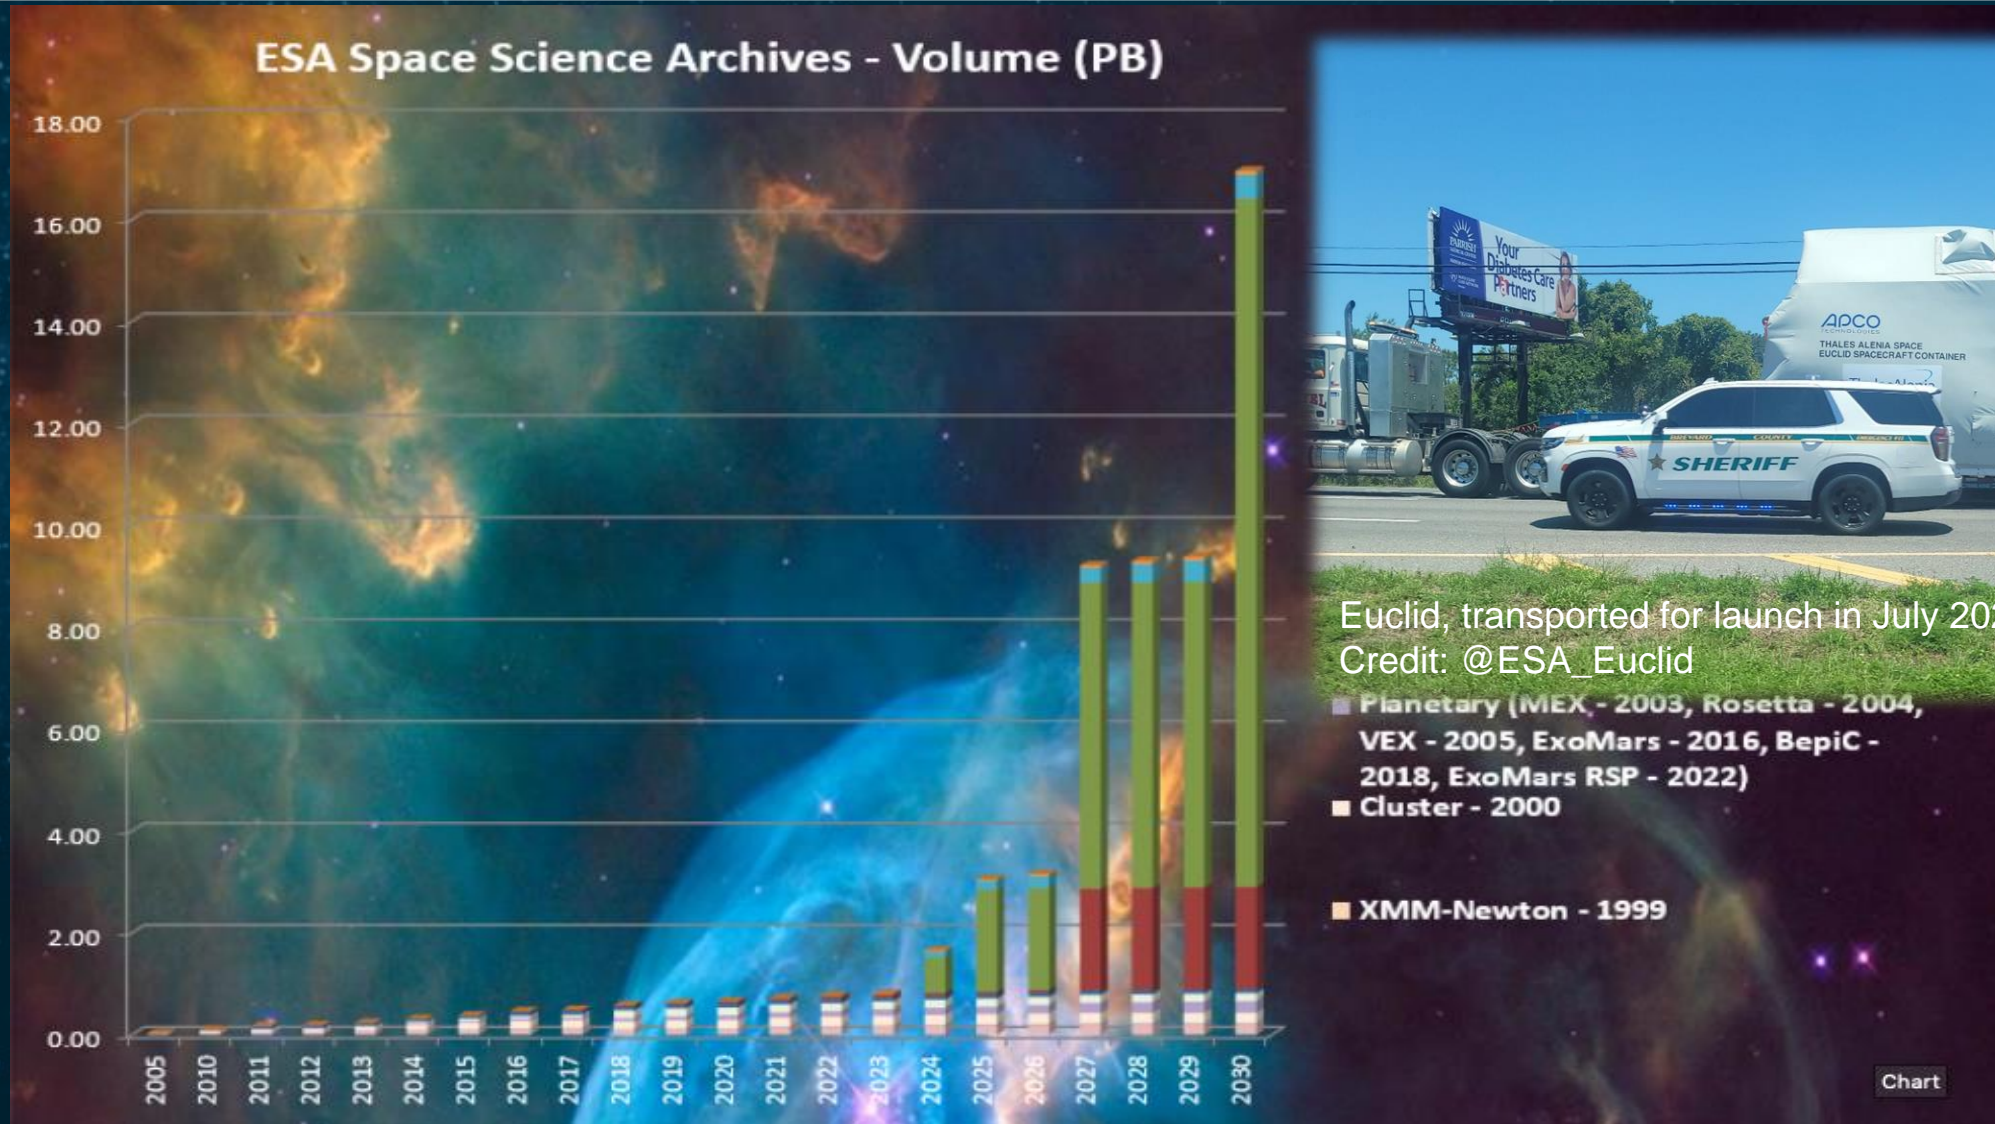

# Motivation: increasing data volumes in astronomy

# Motivation: increasing data volumes in astronomy

Happy international asteroid day! [The current dataset has finished](#) and the science team is working on analysing your classifications.

Help us find asteroids in images  
from the Hubble Space Telescope!

[Learn more](#)

Get started 

If you are for the first time on this project, choose "Training". Otherwise, move on to "Classify" and hunt for asteroids in Hubble images!

[Training](#)

# Satellite trails identified with AutoML in Hubble images

Satellite trails in HST ACS images (exposure time ~11 minutes)

# Fraction of HST images crossed by satellites

2.7% of individual exposures of 11 min crossed by satellites (3.2% ACS and 1.7% of WFC3 impacted)

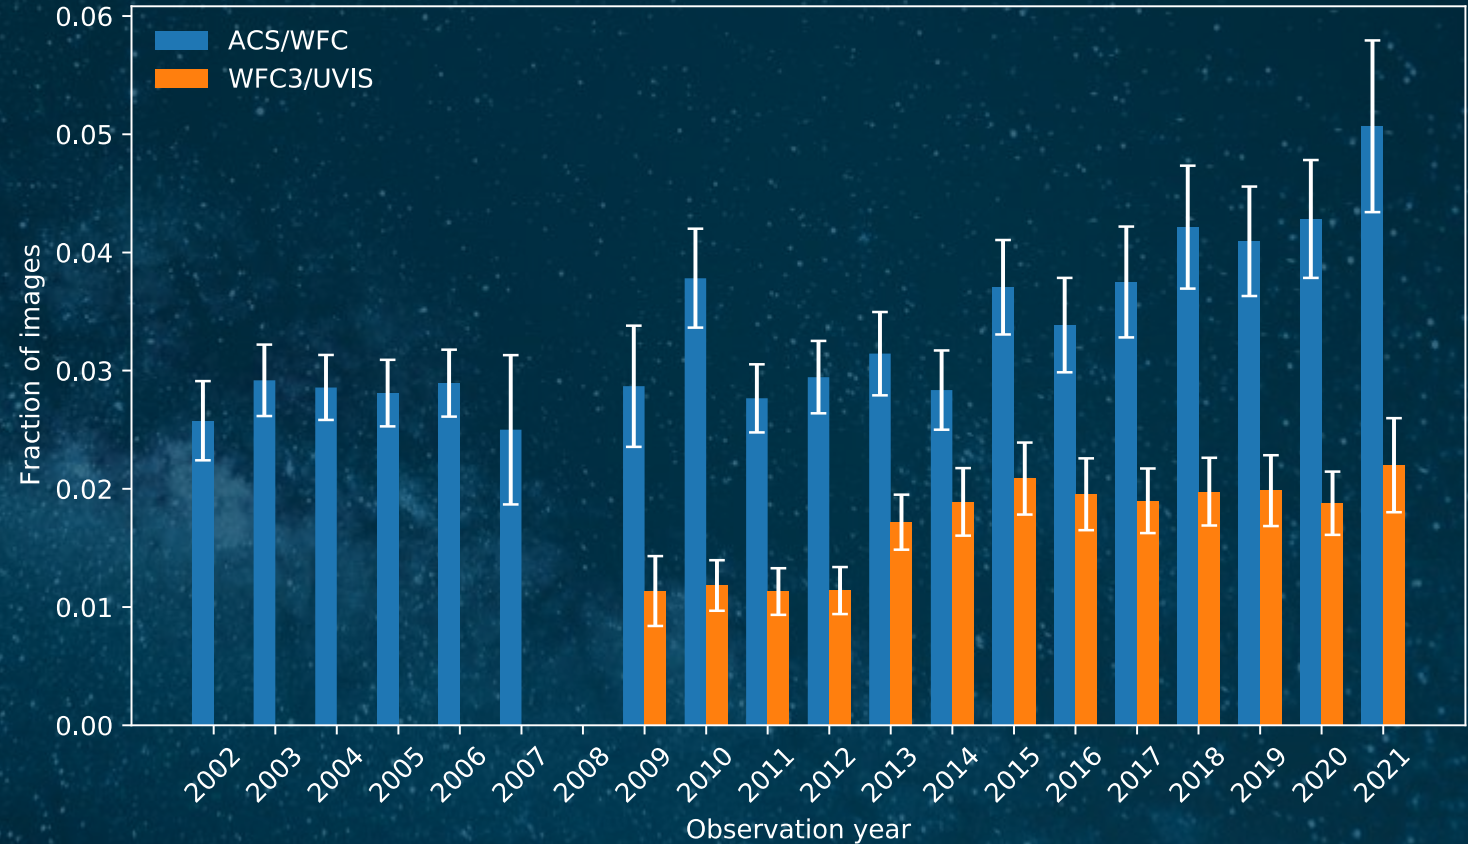

Fraction of images crossed by satellites ~ doubled in the last 20 years, matching the increase in satellite numbers

ACS FoV = 202"x202"  
WFC3 FoV = 160"x160"

HST raw images with satellite trails by instrument

Kruk et al. 2023, *The impact of satellite trails on Hubble Space Telescope observations*

## Artificial intelligence and crowdsourcing

New tools are needed to analyse and mine the increasingly large datasets. Human (e.g. crowdsourcing) and machine collaboration is important to create AI- ready datasets and avoid the garbage-in garbage-out problem.

## Importance of conversations about data

Project forums provide the ideal setup for conversations between scientists and volunteers. It can lead to new discoveries: strong lenses and artificial satellites.

## Necessity of data platforms

Google Cloud provided the framework to train deep learning algorithms and predict the presence of asteroids in HST images.

Foreground asteroid passing in front of the Crab Nebula, identified in the Hubble Asteroid Hunter project. Credit: ESA/Hubble & NASA, M. Thévenot
