

Python Discussion

- VOTable parsing into an Astropy Table is built into Astropy.
- We are seeing recent VO developments in Astroquery
 - TAP/TAPPlus, DataLink (GAIA)
 - CADC-TAP
 - MOC/HEALPIX (CDS)
 - Simplified Registry interface, SIA, SSA (in-progress, NAVO)
 - Etc.
- We have seen recent developments in PyVO
 - Had been quiet until relatively recently

Where should we be putting new development?

- PyVO was there first, but the community is familiar with Astroquery.
- If Astroquery, what to do with PyVO?

Does it matter? Should we coordinate, or just let it evolve as it might just within the open source community?

- Couldn't some coordination optimize the design and eliminate duplications?
