

Firefly Support

Service Descriptors

Adding VO Standards

- May 2018: HiPS

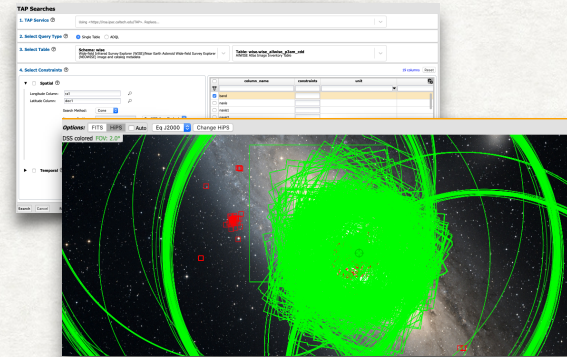

- Fall 2018 - MOC

- Spring 2019

- TAP
- ObsCore & DataLink (partial)
- s_region visualization

- Winter 2020 - Service Descriptors

- Datalink (Completed)
- Standalone

```
<RESOURCE type="meta" utype="ad hoc:service" >
  <DESCRIPTION>Link to ZTF light curve for ztf_dr3 collection</DESCRIPTION>
  <GROUP name="inputParams">
    <PARAM name="id" datatype="char" arraysize="*" ref="col_0" value="" >
      <DESCRIPTION>Identifier of a ZTF object.</DESCRIPTION>
    </PARAM>
    <PARAM name="bad_catflags_mask" datatype="int" value="0" >
      <DESCRIPTION>Bitmask used to exclude lightcurve points with at least one of the indicated catflag bits set. Default is 0.</DESCRIPTION>
    </PARAM>
    <PARAM name="time" datatype="char" arraysize="*" value="" >
      <DESCRIPTION>Date-time range for which lightcurve data is to be retrieved, unlimited by default. Space-separated range endpoint(s) are int
    </PARAM>
  </GROUP>
  <PARAM name="standardID" datatype="char" arraysize="*" value="ivo://ivos.net/std/DataLink#Links-1.0" />
  <PARAM name="accessURL" datatype="char" arraysize="*" value="https://irsa.ipac.caltech.edu/cgi-bin/ZTF/nph_light_curves?collection=ztf_dr3" />
</RESOURCE>
```

What was Easy

- Spec easy to follow
- We have existing services (CADDC, IRSA new service) to try
- VO file are easy to edit and try stuff
- It is clear that Datalink and Service Descriptors have tremendous potential
- Service Descriptors could be added to virtually any homogeneous data product table

UI Challenges

- Must Analyze the Data
 - VO: How many tables?
 - FITS: how many HDUs? What are they?
 - Solution: Download and Analyze
- Multiple data products (file) each with multiple data sets
- Getting input from array parameters
- Optional vs required parameters

Can we indicate optional/required in the spec?

Challenges with Standalone Service Descriptors

Service Descriptors: With Datalink vs Standalone

Issue	With Datalink	Standalone
content_type	<i>given</i>	Must Download or header (HEAD)
content_length	<i>given</i>	Must Download or header (HEAD)
semantics	<i>given</i>	No solution
description	<i>given</i>	Maybe if Service Descriptors include a <description> tag
What is in the file	Must Download and Analyze	Must Download and Analyze

Can we put all of it in the Service Descriptor?

Challenge with creating URLs

```
<PARAM name="CIRCLE" datatype="double" arraysize="3" ucd="obs.field" unit="deg" xtype="circle" value="">  
  <VALUES>  
    <MAX value="10.685001466285922 41.25363121467171 0.7002317445980466" />  
  </VALUES>  
</PARAM>
```

- *Should this be?*
 - &CIRCLE=10.6 , 41.2 , 0.7 or
 - &CIRCLE=10.6 ; 41.2 ; 0.7 or
 - &CIRCLE=10.6 41.2 0.7 or
 - &CIRCLE= [10.6 , 41.2 , 0.7]
- Does it support scientific notation? 7E-3

Could Service descriptors include a working example?

Challenges with launching other Web Apps

- Data Products vs Web Application
- How do we know if the service is a web application?
 - Our Solution:
 - content type: "text/html"
 - Launch app
- Protocol does not really have a way to define a URL that takes another URL

Could the spec include data product or App?

Challenge: Did we implement it correctly?

It would be nice to have a validation suite

- Server running in the docker container
- Takes a TAP request and returns the same result for any tap search
- Implements obscore and services descriptors
- Maybe has about 5 or 10 different data product files that is returns

Datalink

ObsCore

Service Descriptors

Huge Potential
