Radio Interest Group

- Session discussed possible Obscore extensions for visibility metadata, and mapping Pulsar data into ObsCore.
  - One question that is also relevant for other types of data (X-rays, time domain): is it better to extend Obscore directly to store metadata that might only be relevant for some types of data, or have extension tables for lower-level data that are not high level images or spectra? If we have extensions, how do we transmit that information through the registry?

- Will hold a meeting on time domain data (pulsar/FRB) with TDIG and another meeting on single dish data before the next interop.
